**Computer Science ... A UCB view**

- CS research areas:
  - Artificial Intelligence
  - Biosystems & Computational Biology
  - Database Management Systems
  - Graphics
  - Human-Computer Interaction
  - Networking
  - Programming Systems
  - Scientific Computing
  - Security
  - Systems
  - Theory
    - Complexity theory
  - ...

Chun, Summer 2012

UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (2)

**Let's revisit algorithm complexity**

- Problems that...
  - are tractable with efficient solutions in reasonable time
  - are intractable
  - are solvable approximately, not optimally
  - have no known efficient solution
  - are not solvable

Chun, Summer 2012

UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (3)

en.wikipedia.org/wiki/P\_(complexity)

**Tractable with efficient sols in reas time**

- Recall our algorithm complexity lecture, we've got several common orders of growth
  - Constant
  - Logarithmic
  - Linear
  - Quadratic
  - Cubic
  - Exponential
- Order of growth is polynomial in the size of the problem
- E.g.,
  - Searching for an item in a collection
  - Sorting a collection
  - Finding if two numbers in a collection are same
- These problems are called being "in P" (for polynomial)

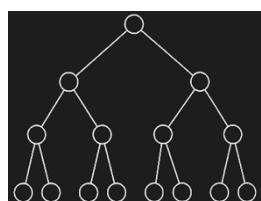

Chun, Summer 2012

UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (4)

en.wikipedia.org/wiki/Intractability\_(complexity)#Intractability

**Intractable problems**

- Problems that can be solved, but not solved fast enough
- This includes exponential problems
  - E.g.,  $f(n) = 2^n$ 
    - as in the image to the right
- This also includes poly-time algorithm with a huge exponent
  - E.g.,  $f(n) = n^{10}$
- Only solve for small n

Imagine a program that calculated something important at each of the bottom circles. This tree has height n, but there are  $2^n$  bottom circles!

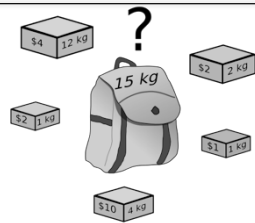

Chun, Summer 2012

UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (5)

en.wikipedia.org/wiki/Knapsack\_problem

**Solvable approximately, not optimally in reas time**

- A problem might have an optimal solution that cannot be solved in reasonable time
- BUT if you don't need to know the perfect solution, there might exist algorithms which could give pretty good answers in reasonable time

**Knapsack Problem**  
You have a backpack with a weight limit (here 15kg), which boxes (with weights and values) should be taken to maximize value?

Chun, Summer 2012

UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (6)

Peer Instruction

What's the most you can put in your knapsack?

**Knapsack Problem**  
You have a backpack with a weight limit (here **15kg**), which boxes (with weights and values) should be taken to maximize value?  
*(any # of each box is available)*

a) \$10  
b) \$15  
c) \$33  
d) \$36  
e) \$40

en.wikipedia.org/wiki/P\_3D\_NP\_problem

Have no known efficient solution

▪ Solving one of them would solve an entire class of them!

▪ We can transform one to another, i.e., reduce

▪ A problem P is "hard" for a class C if every element of C can be "reduced" to P

▪ If you're "in NP" and "NP-hard", then you're "NP-complete"

▪ If you guess an answer, can I verify it in polynomial time?

▪ Called being "in NP"

▪ Non-deterministic (the "guess" part) Polynomial

**-2 -3 15**  
**14 7 -10**

**Subset Sum Problem**  
Are there a handful of these numbers (at least 1) that add together to get 0?

en.wikipedia.org/wiki/P\_3D\_NP\_problem  
Chun, Summer 2018  
UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (8)

en.wikipedia.org/wiki/P\_3D\_NP\_problem

The fundamental question. Is P = NP?

▪ This is THE major unsolved problem in Computer Science!

▪ One of 7 "millennium prizes" w/a \$1M reward

▪ All it would take is solving ONE problem in the NP-complete set in polynomial time!!

▪ Huge ramifications for cryptography, others

If P ≠ NP, then

NP Problems

P Problems

NP Complete

▪ Other NP-Complete

▪ Traveling salesman who needs most efficient route to visit all cities and return home

MY HOBBY:  
EMBEDDING NP-COMPLETE PROBLEMS IN RESTAURANT ORDERS

CHOUCHERIES RESTAURANT

APPETIZERS

MIXED FRUIT 2.15  
FRENCH FRIES 2.75  
SIDE SALAD 3.35  
HOT WINGS 3.55  
MOZZARELLA STICKS 4.20  
SAMPLER PLATE 5.80  
SANDWICHES  
BARBECUE 6.55

WED LIKE EXACTLY \$15.05 WORTH OF APPETIZERS, PLEASE.

... EXACTLY? UHM...

HERE, THESE PAPERS ON THE KNAPSACK PROBLEM MIGHT HELP YOU OUT.

LISTEN, I HAVE SIX OTHER TABLES TO GET TO --

-- AS FAST AS POSSIBLE, OF COURSE. WHAT SOMETHING ON TRAVELING SALESMAN?

en.wikipedia.org/wiki/P\_3D\_NP\_problem

UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (10)

www.cgl.uwaterloo.ca/~csk/halt/

Problems NOT solvable

▪ **Decision problems** answer YES or NO for an infinite # of inputs

▪ E.g., is N prime?

▪ E.g., is sentence S grammatically correct?

▪ An algorithm is a solution if it correctly answers YES/NO in a finite amount of time

▪ A problem is **decidable** if it has a solution

**Alan Turing**  
asked, "Are all problems decidable?"  
(People believed yes at the time.)  
Turing proved they are not!

en.wikipedia.org/wiki/P\_3D\_NP\_problem  
Chun, Summer 2018  
UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (11)

Review: Proof by Contradiction

▪ Infinitely Many Primes?

▪ Assume the contrary, then prove that it's impossible

▪ Only a finite # of primes

▪ Number them  $p_1, p_2, \dots, p_n$

▪ Consider the number q

•  $q = (p_1 * p_2 * \dots * p_n) + 1$

• Dividing q by any prime would give a remainder of 1

• So q isn't composite, q is prime

• But we said  $p_n$  was the biggest, and q is bigger than  $p_n$

▪ So there IS no biggest  $p_n$

**Euclid**

Chun, Summer 2018  
UC Berkeley CS10 "The Beauty and Joy of Computing": Limits of Computability (12)

## Turing's proof : The Halting Problem

- Given a program and some input, will that program eventually stop? (or will it loop)
- Assume we could write it, then let's prove a contradiction
  - 1. write Stops on Self?
  - 2. Write Weird
  - 3. Call Weird on itself

Chen, Summer 2012

## Conclusion

- Complexity theory important part of CS
- If given a hard problem, rather than try to solve it yourself, see if others have tried similar problems
- If you don't need an exact solution, many approximation algorithms help
- Some not solvable!

P=NP question even made its way into popular culture, here shown in the Simpsons 3D episode!

Chen, Summer 2012
