## Foundations of Computer Graphics

(Fall 2012)
CS 184, Lecture 16: Ray Tracing
http://inst.eecs.berkeley.edu/~cs184

## Effects needed for Realism

- (Soft) Shadows
- Reflections (Mirrors and Glossy)
- Transparency (Water, Glass)
- Interreflections (Color Bleeding)
- Complex Illumination (Natural, Area Light)
- Realistic Materials (Velvet, Paints, Glass)
- And many more

## Ray Tracing

- Different Approach to Image Synthesis as compared to Hardware pipeline (OpenGL)
- Pixel by Pixel instead of Object by Object
- Easy to compute shadows/transparency/etc

## Ray Tracing History

Ray Tracing in Computer Graphics

Appel 1968 - Ray casting

1. Generate an image by sending one ray per pixel
2. Check for shadows by sending a ray to the light

$512 \times 512$
Time:
VAX 11/780 (1979)
74 min.
PC (2006)
6 sec.
Spheres and Checkerboard, T. Whitted, 1979 CS3ses Lecture 2

## Comparison to hardware scan-line

- Per-pixel evaluation, per-pixel rays (not scan-convert each object). On face of it, costly
- But good for walkthroughs of extremely large models (amortize preprocessing, low complexity)
- More complex shading, lighting effects possible

Shatdowragydditightsistblocked: objiectvisibhadow

## Shadows: Numerical Issues

- Numerical inaccuracy may cause intersection to be below surface (effect exaggerated in figure)
- Causing surface to incorrectly shadow itself
- Move a little towards light before shooting shadow ray

Problems with Recursion

- Reflection rays may be traced forever
- Generally, set maximum recursion depth
- Same for transmitted rays (take refraction into account)

## Outline

- History
- Basic Ray Casting (instead of rasterization)
- Comparison to hardware scan conversion
- Shadows / Reflections (core algorithm)
- Ray-Surface Intersection
- Optimizations
- Current Research

Discussed in this lecture
Not discussed but possible with distribution ray tracing (13)
Hard (but not impossible) with ray tracing; radiosity methods

## Ray/Object Intersections

- Heart of Ray Tracer
- One of the main initial research areas
- Optimized routines for wide variety of primitives
- Various types of info
- Shadow rays: Intersection/No Intersection
- Primary rays: Point of intersection, material, normals
- Texture coordinates
- Work out examples
- Triangle, sphere, polygon, general implicit surface

Ray-Sphere Intersection
ray $\equiv \vec{P}=\vec{P}_{0}+\vec{P}_{1} t$
sphere $\equiv(\vec{P}-\vec{C}) \cdot(\vec{P}-\vec{C})-r^{2}=0$

## Ray-Sphere Intersection

$$
\begin{aligned}
& \text { ray } \equiv \vec{P}=\vec{P}_{0}+\vec{P}_{1} t \\
& \text { sphere } \equiv(\vec{P}-\vec{C}) \cdot(\vec{P}-\vec{C})-r^{2}=0
\end{aligned}
$$

Substitute

$$
\begin{aligned}
& \text { ray } \equiv \vec{P}=\vec{P}_{0}+\vec{P}_{1} t \\
& \text { sphere } \equiv\left(\vec{P}_{0}+\vec{P}_{1} t-\vec{C}\right) \cdot\left(\vec{P}_{0}+\vec{P}_{1} t-\vec{C}\right)-r^{2}=0
\end{aligned}
$$

Simplify
$t^{2}\left(\vec{P}_{1} \cdot \vec{P}_{1}\right)+2 t \vec{P}_{1} \cdot\left(\vec{P}_{0}-\vec{C}\right)+\left(\vec{P}_{0}-\vec{C}\right) \cdot\left(\vec{P}_{0}-\vec{C}\right)-r^{2}=0$

Ray-Sphere Intersection
$t^{2}\left(\vec{P}_{1} \cdot \vec{P}_{1}\right)+2 t \vec{P}_{1} \cdot\left(\vec{P}_{0}-\vec{C}\right)+\left(\vec{P}_{0}-\vec{C}\right) \cdot\left(\vec{P}_{0}-\vec{C}\right)-r^{2}=0$
Solve quadratic equations for $t$

- 2 real positive roots: pick smaller root
- Both roots same: tangent to sphere
- One positive, one negative root: ray origin inside sphere (pick + root)
- Complex roots: no intersection (check discriminant of equation first)

## Ray inside Triangle

$$
\begin{aligned}
& P=\alpha A+\beta B+\gamma C \\
& \alpha \geq 0, \beta \geq 0, \gamma \geq 0 \\
& \alpha+\beta+\gamma=1
\end{aligned}
$$

$$
\begin{aligned}
& P-A=\beta(B-A)+\gamma(C-A) \\
& 0 \leq \beta \leq 1,0 \leq \gamma \leq 1 \\
& \beta+\gamma \leq 1
\end{aligned}
$$

## Other primitives

- Much early work in ray tracing focused on ray-primitive intersection tests
- Cones, cylinders, ellipsoids
- Boxes (especially useful for bounding boxes)
- General planar polygons
- Many more
- Many references. For example, chapter in Glassner introduction to ray tracing (see me if interested)

## Ray-Tracing Transformed Objects

We have an optimized ray-sphere test
" But we want to ray trace an ellipsoid..
Solution: Ellipsoid transforms sphere

- Apply inverse transform to ray, use ray-sphere
- Allows for instancing (traffic jam of cars)

Mathematical details worked out in class

## Transformed Objects

- Consider a general $4 \times 4$ transform M
- Will need to implement matrix stacks like in OpenGL
- Apply inverse transform $\mathrm{M}^{-1}$ to ray
" Locations stored and transform in homogeneous coordinates
- Vectors (ray directions) have homogeneous coordinate set to 0 [so there is no action because of translations]
- Do standard ray-surface intersection as modified
- Transform intersection back to actual coordinates
- Intersection point p transforms as Mp
- Distance to intersection if used may need recalculation
- Normals $n$ transform as $M^{-t} n$. Do all this before lighting

## Outline

- History
- Basic Ray Casting (instead of rasterization)
- Comparison to hardware scan conversion
- Shadows / Reflections (core algorithm)
- Ray-Surface Intersection
- Optimizations
- Current Research

## Acceleration

Testing each object for each ray is slow

- Fewer Rays

Adaptive sampling, depth control

- Generalized Rays

Beam tracing, cone tracing, pencil tracing etc.

- Faster Intersections

Optimized Ray-Object Intersections

- Fewer Intersections

## Outline

- History
- Basic Ray Casting (instead of rasterization)
- Comparison to hardware scan conversion
- Shadows / Reflections (core algorithm)
- Ray-Surface Intersection
- Optimizations
- Current Research
