#### CS61B Lecture #11

- Please report problems (missing files, malfunctions of submit, etc.)
   by email, not by the newsgroup, for faster service.
- Midterm is 9 March at 6:30PM in 10 Evans.

# Example: Comparable

 Java library provides an interface to describe Objects that have a natural order on them, such as String, Integer, BigInteger and BigDecimal:

```
public interface Comparable { // For now, the Java 1.4 version
  /** Returns value <0, == 0, or > 0 depending on whether
   * THIS is <, ==, or > OBJ. Exception if OBJ not of compatible type. */
  int compareTo (Object obj);
```

Might use in a general-purpose max function:

```
/** The largest value in array A, or null if A empty. */
public static Comparable max (Comparable[] A) {
  if (A.length == 0) return null;
  Comparable result; result = A[0];
  for (int i = 1; i < A.length; i += 1)
    if (result.compareTo (A[i]) < 0) result = A[i];</pre>
  return result;
```

 Now max(S) will return maximum value in S if S is an array of Strings, or any other kind of Object that implements Comparable.

# Example: Readers

- Java class java.io. Reader abstracts sources of characters.
- Here, we present a revisionist version (not the real thing):

```
public interface Reader { // Real java.io.Reader is abstract class
  /** Release this stream: further reads are illegal */
  void close ();
  /** Read as many characters as possible, up to LEN,
   * into BUF[OFF], BUF[OFF+1],..., and return the
   * number read, or -1 if at end-of-stream. */
  int read (char[] buf, int off, int len);
  /** Short for read (BUF, 0, BUF.length). */
  int read (char[] buf);
  /** Read and return single character, or -1 at end-of-stream. */
  int read ();
}
```

Can't write new Reader(); it's abstract. So what good is it?

# Generic Partial Implementation

- According to their specifications, some of Reader's methods are related.
- Can express this with a partial implementation, which leaves key methods unimplemented and provides default bodies for others.
- Result still abstract: can't use new on it.

```
/** A partial implementation of Reader. Complete
  * implementations MUST override close and read(,,).
  * They MAY override the other read methods for speed. */
public abstract class AbstractReader implements Reader {
  public abstract void close ();
  public abstract int read (char[] buf, int off, int len);

  public int read (char[] buf) { return read(buf,0,buf.length); }

  public int read () { return (read (buf1) == -1) ? -1 : buf1[0]; }

  private char[] buf1 = new char[1];
}
```

# Implementation of Reader: StringReader

The class StringReader reads characters from a String:

```
public class StringReader extends AbstractReader {
  private String str;
  private int k;
  /** A Reader delivering the characters in STR. */
  public StringReader (String str)
    { this.str = str; k = 0; }
  public void close () { str = null; }
  public int read (char[] buf, int off, int len) {
    if (k == str.length ())
      return -1;
    len = Math.min (len, str.length () - k);
    str.getChars (k, k+len, buf, off);
    k += len;
    return len;
```

# Using Reader

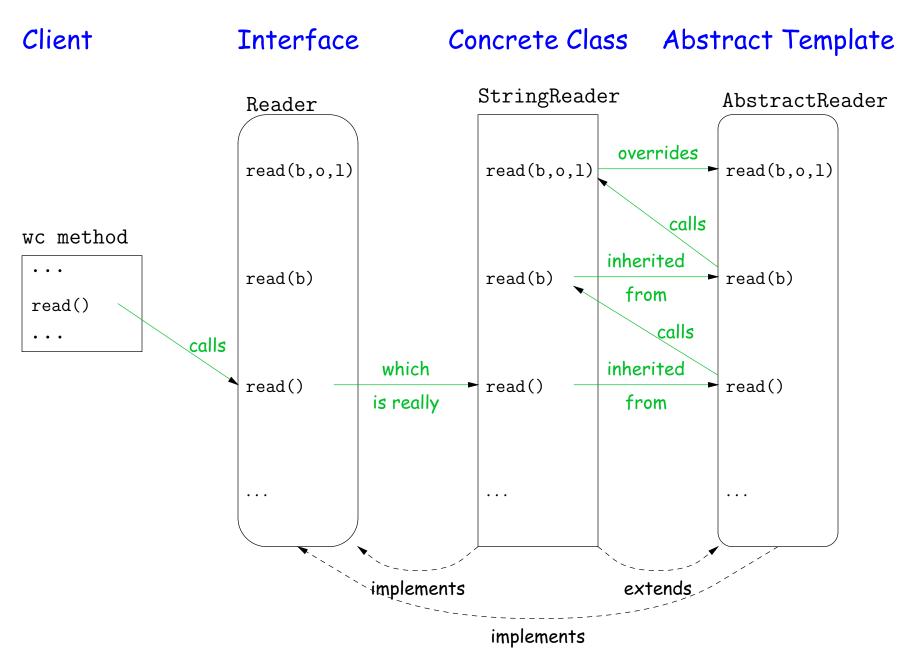

#### Consider this method, which counts words:

```
/** The total number of words in R, where a "word" is
    a maximal sequence of non-whitespace characters. */
int wc (Reader r) {
  int c0, count;
  c0 = ' : cnt = 0;
 while (true) {
    int c = r.read();
    if (c == -1) return count;
    if (Character.isWhitespace ((char) c0) && ! Character.isWhitespace ((char) c))
      count += 1:
    c0 = c:
}
```

#### This method works for any Reader:

```
// Number of words in the String someText:
wc (new StringReader (someText))
// Number of words in standard input.
wc (new InputStreamReader (System.in))
                                              other implementations of Reader
  Number of words in file named fileName:
wc (new FileReader (fileName))
```

# How It Fits Together

#### essons.

- The Reader interface class served as a specification for a whole set of readers.
- Ideally, most client methods that deal with Readers, like wc, will specify type Reader for the formal parameters, not a specific kind of Reader, thus assuming as little as possible.
- And only when a client creates a new Reader will it get specific about what subtype of Reader it needs.
- That way, client's methods are as widely applicable as possible.
- Finally, AbstractReader is a tool for implementors of non-abstract Reader classes, and not used by clients.
- Alas, Java library is not pure. E.g., AbstractReader is really just called Reader and there is no interface. In this example, we saw what they should have done!
- The Comparable interface allows definition of functions that depend only on a limited subset of the properties (methods) of their arguments (such as "must have a compareTo method").
