### Probability of exactly one 'heads' in two coin flips?

Idea: Sum the probabilities of all the different outcomes that have exactly one 'heads':  $HT, TH$ .

This leads to a definition!

#### Definition:

- ▶ An **event**,  $E$ , is a subset of outcomes:  $E \subset \Omega$ .
- ▶ The **probability of  $E$**  is defined as  $Pr[E] = \sum_{\omega \in E} Pr[\omega]$ .

## Probability Basics Review

### Setup:

- ▶ Random Experiment.  
Flip a fair coin twice.
- ▶ Probability Space.
  - ▶ **Sample Space:** Set of outcomes,  $\Omega$ .  
 $\Omega = \{HH, HT, TH, TT\}$   
(Note: **Not**  $\Omega = \{H, T\}$  with two picks!)
  - ▶ **Probability:**  $Pr[\omega]$  for all  $\omega \in \Omega$ .  
 $Pr[HH] = \dots = Pr[TT] = 1/4$ 
    1.  $0 \leq Pr[\omega] \leq 1$ .
    2.  $\sum_{\omega \in \Omega} Pr[\omega] = 1$ .

### Event: Example

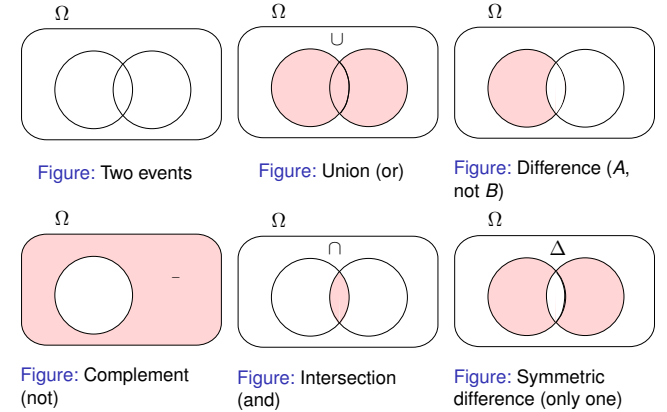

$$\Omega = \{\text{Red, Green, Yellow, Blue}\}$$

$$Pr[\text{Red}] = \frac{3}{10}, Pr[\text{Green}] = \frac{4}{10}, \text{ etc.}$$

$$E = \{\text{Red, Green}\} \Rightarrow Pr[E] = \frac{3+4}{10} = \frac{3}{10} + \frac{4}{10} = Pr[\text{Red}] + Pr[\text{Green}].$$

## Set notation review

### Probability of exactly one heads in two coin flips?

Sample Space,  $\Omega = \{HH, HT, TH, TT\}$ .

Uniform probability space:

$$Pr[HH] = Pr[HT] = Pr[TH] = Pr[TT] = \frac{1}{4}.$$

Event,  $E$ , "exactly one heads":  $\{TH, HT\}$ .

$$Pr[E] = \sum_{\omega \in E} Pr[\omega] = \frac{|E|}{|\Omega|} = \frac{2}{4} = \frac{1}{2}.$$

### Example: 20 coin tosses.

#### 20 coin tosses

Sample space:  $\Omega =$  set of 20 fair coin tosses.  
 $\Omega = \{T, H\}^{20} \equiv \{0, 1\}^{20}$ ;  $|\Omega| = 2^{20}$ .

- ▶ What is more likely?
  - ▶  $\omega_1 := (1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1)$ , or
  - ▶  $\omega_2 := (1, 0, 1, 1, 0, 0, 0, 1, 0, 1, 0, 1, 1, 0, 1, 1, 1, 0, 0, 0)$ ?

Answer: Both are equally likely:  $Pr[\omega_1] = Pr[\omega_2] = \frac{1}{|\Omega|}$ .

- ▶ What is more likely?

- ( $E_1$ ) Twenty Hs out of twenty, or
- ( $E_2$ ) Ten Hs out of twenty?

Answer: Ten Hs out of twenty.

Why? There are many sequences of 20 tosses with ten Hs; only one with twenty Hs.  $\Rightarrow Pr[E_1] = \frac{1}{|\Omega|} \ll Pr[E_2] = \frac{|E_2|}{|\Omega|}$ .

$$|E_2| = \binom{20}{10} = 184,756.$$

### Probability of $n$ heads in 100 coin tosses.

$$\Omega = \{H, T\}^{100}; |\Omega| = 2^{100}.$$

Event  $E_n =$  ' $n$  heads';  $|E_n| = \binom{100}{n}$

$$p_n := Pr[E_n] = \frac{|E_n|}{|\Omega|} = \frac{\binom{100}{n}}{2^{100}}$$

Observe:

- ▶ Concentration around mean: Law of Large Numbers;
- ▶ Bell-shape: Central Limit Theorem.

### Roll a red and a blue die.

### Exactly 50 heads in 100 coin tosses.

Sample space:  $\Omega =$  set of 100 coin tosses  $= \{H, T\}^{100}$ .  
 $|\Omega| = 2 \times 2 \times \dots \times 2 = 2^{100}$ .

Uniform probability space:  $Pr[\omega] = \frac{1}{2^{100}}$ .

Event  $E =$  "100 coin tosses with exactly 50 heads"

$|E|$ ?

Choose 50 positions out of 100 to be heads.

$$|E| = \binom{100}{50}.$$

$$Pr[E] = \frac{\binom{100}{50}}{2^{100}}.$$

#### Calculation.

Stirling formula (for large  $n$ ):

$$n! \approx \sqrt{2\pi n} \left(\frac{n}{e}\right)^n.$$

$$\binom{2n}{n} \approx \frac{\sqrt{4\pi n} (2n/e)^{2n}}{[\sqrt{2\pi n} (n/e)^n]^2} \approx \frac{4^n}{\sqrt{\pi n}}.$$

$$Pr[E] = \frac{|E|}{|\Omega|} = \frac{|E|}{2^{2n}} = \frac{1}{\sqrt{\pi n}} = \frac{1}{\sqrt{50\pi}} \approx .08.$$

### Exactly 50 heads in 100 coin tosses.

## Probability is Additive

### Theorem

(a) If events  $A$  and  $B$  are disjoint, i.e.,  $A \cap B = \emptyset$ , then

$$Pr[A \cup B] = Pr[A] + Pr[B].$$

(b) If events  $A_1, \dots, A_n$  are **pairwise** disjoint, i.e.,  $A_k \cap A_m = \emptyset, \forall k \neq m$ , then

$$Pr[A_1 \cup \dots \cup A_n] = Pr[A_1] + \dots + Pr[A_n].$$

### Proof:

Obvious.

## Total probability

Assume that  $\Omega$  is the union of the disjoint sets  $A_1, \dots, A_N$ .

Then,

$$Pr[B] = Pr[A_1 \cap B] + \dots + Pr[A_N \cap B].$$

Indeed,  $B$  is the union of the disjoint sets  $A_n \cap B$  for  $n = 1, \dots, N$ .

## Consequences of Additivity

### Theorem

(a)  $Pr[A \cup B] = Pr[A] + Pr[B] - Pr[A \cap B]$ ;

(inclusion-exclusion property)

(b)  $Pr[A_1 \cup \dots \cup A_n] \leq Pr[A_1] + \dots + Pr[A_n]$ ;

(union bound)

(c) If  $A_1, \dots, A_N$  are a **partition** of  $\Omega$ , i.e., pairwise disjoint and  $\cup_{m=1}^N A_m = \Omega$ , then

$$Pr[B] = Pr[B \cap A_1] + \dots + Pr[B \cap A_N].$$

(law of total probability)

### Proof:

(b) is obvious.

See next two slides for (a) and (c).

## Inclusion/Exclusion

$$Pr[A \cup B] = Pr[A] + Pr[B] - Pr[A \cap B]$$

## Roll a Red and a Blue Die.

$$|E_1 \cup E_2| = |E_1| + |E_2| - |E_1 \cap E_2|$$

$E_1 =$  'Red die shows 6';  $E_2 =$  'Blue die shows 6'

$E_1 \cup E_2 =$  'At least one die shows 6'

$$Pr[E_1] = \frac{6}{36}, Pr[E_2] = \frac{6}{36}, Pr[E_1 \cup E_2] = \frac{11}{36}.$$

## Conditional probability: example.

Two coin flips. First flip is heads. Probability of two heads?

$\Omega = \{HH, HT, TH, TT\}$ ; Uniform probability space.

Event  $A =$  first flip is heads:  $A = \{HH, HT\}$ .

$\Omega$ : uniform

New sample space:  $A$ ; uniform still.

Event  $B =$  two heads.

The probability of two heads if the first flip is heads.

**The probability of  $B$  given  $A$  is  $1/2$ .**

### A similar example.

Two coin flips. At least one of the flips is heads.  
 → Probability of two heads?

$\Omega = \{HH, HT, TH, TT\}$ ; uniform.

Event  $A =$  at least one flip is heads.  $A = \{HH, HT, TH\}$ .

New sample space:  $A$ ; uniform still.

Event  $B =$  two heads.

The probability of two heads if at least one flip is heads.

The probability of  $B$  given  $A$  is  $1/3$ .

### Conditional Probability: A non-uniform example

Physical experiment

Probability model

$\Omega = \{\text{Red, Green, Yellow, Blue}\}$

$$Pr[\text{Red} | \text{Red or Green}] = \frac{3}{7} = \frac{Pr[\text{Red} \cap (\text{Red or Green})]}{Pr[\text{Red or Green}]}$$

### Another non-uniform example

Consider  $\Omega = \{1, 2, \dots, N\}$  with  $Pr[n] = p_n$ .  
 Let  $A = \{3, 4\}, B = \{1, 2, 3\}$ .

$$Pr[A|B] = \frac{p_3}{p_1 + p_2 + p_3} = \frac{Pr[A \cap B]}{Pr[B]}$$

### Yet another non-uniform example

Consider  $\Omega = \{1, 2, \dots, N\}$  with  $Pr[n] = p_n$ .  
 Let  $A = \{2, 3, 4\}, B = \{1, 2, 3\}$ .

$$Pr[A|B] = \frac{p_2 + p_3}{p_1 + p_2 + p_3} = \frac{Pr[A \cap B]}{Pr[B]}$$

### Conditional Probability.

**Definition:** The conditional probability of  $B$  given  $A$  is

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}$$

In  $A!$   
 In  $B?$   
 Must be in  $A \cap B$ .

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}$$

### More fun with conditional probability.

Toss a red and a blue die, sum is 4,  
 What is probability that red is 1?

$Pr[B|A] = \frac{|B \cap A|}{|A|} = \frac{1}{3}$ ; versus  $Pr[B] = 1/6$ .

$B$  is more likely given  $A$ .

### Yet more fun with conditional probability.

Toss a red and a blue die, sum is 7,  
what is probability that red is 1?

$$Pr[B|A] = \frac{|B \cap A|}{|A|} = \frac{1}{6}; \text{ versus } Pr[B] = \frac{1}{6}.$$

Observing  $A$  does not change your mind about the likelihood of  $B$ .

### Emptiness..

Suppose I toss 3 balls into 3 bins.

$A = \text{'1st bin empty'}$ ;  $B = \text{'2nd bin empty'}$ . What is  $Pr[A|B]$ ?

$$Pr[B] = Pr[\{(a, b, c) \mid a, b, c \in \{1, 3\}\}] = Pr[\{1, 3\}^3] = \frac{8}{27}$$

$$Pr[A \cap B] = Pr[(3, 3, 3)] = \frac{1}{27}$$

$$Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]} = \frac{(1/27)}{(8/27)} = 1/8; \text{ vs. } Pr[A] = \frac{8}{27}.$$

$A$  is less likely given  $B$ : If second bin is empty the first is more likely to have balls in it.

### Gambler's fallacy.

Flip a fair coin 51 times.

$A = \text{'first 50 flips are heads'}$

$B = \text{'the 51st is heads'}$

$Pr[B|A]$  ?

$A = \{HH \dots HT, HH \dots HH\}$

$B \cap A = \{HH \dots HH\}$

Uniform probability space.

$$Pr[B|A] = \frac{|B \cap A|}{|A|} = \frac{1}{2}.$$

Same as  $Pr[B]$ .

The likelihood of 51st heads does not depend on the previous flips.

### Product Rule

Recall the definition:

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}.$$

Hence,

$$Pr[A \cap B] = Pr[A]Pr[B|A].$$

Consequently,

$$\begin{aligned} Pr[A \cap B \cap C] &= Pr[(A \cap B) \cap C] \\ &= Pr[A \cap B]Pr[C|A \cap B] \\ &= Pr[A]Pr[B|A]Pr[C|A \cap B]. \end{aligned}$$

### Product Rule

**Theorem** Product Rule

Let  $A_1, A_2, \dots, A_n$  be events. Then

$$Pr[A_1 \cap \dots \cap A_n] = Pr[A_1]Pr[A_2|A_1] \dots Pr[A_n|A_1 \cap \dots \cap A_{n-1}].$$

**Proof:** By induction.

Assume the result is true for  $n$ . (It holds for  $n = 2$ .) Then,

$$\begin{aligned} Pr[A_1 \cap \dots \cap A_n \cap A_{n+1}] &= Pr[A_1 \cap \dots \cap A_n]Pr[A_{n+1}|A_1 \cap \dots \cap A_n] \\ &= Pr[A_1]Pr[A_2|A_1] \dots Pr[A_n|A_1 \cap \dots \cap A_{n-1}]Pr[A_{n+1}|A_1 \cap \dots \cap A_n], \end{aligned}$$

so that the result holds for  $n + 1$ .  $\square$

### Correlation

An example.

Random experiment: Pick a person at random.

Event  $A$ : the person has lung cancer.

Event  $B$ : the person is a heavy smoker.

Fact:

$$Pr[A|B] = 1.17 \times Pr[A].$$

Conclusion:

- ▶ Smoking increases the probability of lung cancer by 17%.
- ▶ Smoking causes lung cancer.

## Correlation

Event  $A$ : the person has lung cancer. Event  $B$ : the person is a heavy smoker.  $Pr[A|B] = 1.17 \times Pr[A]$ .

A second look.

Note that

$$\begin{aligned} Pr[A|B] = 1.17 \times Pr[A] &\Leftrightarrow \frac{Pr[A \cap B]}{Pr[B]} = 1.17 \times Pr[A] \\ &\Leftrightarrow Pr[A \cap B] = 1.17 \times Pr[A] Pr[B] \\ &\Leftrightarrow Pr[B|A] = 1.17 \times Pr[B]. \end{aligned}$$

Conclusion:

- ▶ Lung cancer increases the probability of smoking by 17%.
- ▶ Lung cancer causes smoking. **Really?**

## Total probability

Assume that  $\Omega$  is the union of the disjoint sets  $A_1, \dots, A_N$ .

Then,

$$Pr[B] = Pr[A_1 \cap B] + \dots + Pr[A_N \cap B].$$

Indeed,  $B$  is the union of the disjoint sets  $A_n \cap B$  for  $n = 1, \dots, N$ .

Thus,

$$Pr[B] = Pr[A_1]Pr[B|A_1] + \dots + Pr[A_N]Pr[B|A_N].$$

## Causality vs. Correlation

Events  $A$  and  $B$  are **positively correlated** if

$$Pr[A \cap B] > Pr[A]Pr[B].$$

(E.g., smoking and lung cancer.)

$A$  and  $B$  being positively correlated does not mean that  $A$  causes  $B$  or that  $B$  causes  $A$ .

Other examples:

- ▶ Tesla owners are more likely to be rich. That does not mean that poor people should buy a Tesla to get rich.
- ▶ People who go to the opera are more likely to have a good career. That does not mean that going to the opera will improve your career.
- ▶ Rabbits eat more carrots and do not wear glasses. Are carrots good for eyesight?

## Total probability

Assume that  $\Omega$  is the union of the disjoint sets  $A_1, \dots, A_N$ .

$$Pr[B] = Pr[A_1]Pr[B|A_1] + \dots + Pr[A_N]Pr[B|A_N].$$

## Proving Causality

Proving causality is generally difficult. One has to eliminate external causes of correlation and be able to test the cause/effect relationship (e.g., randomized clinical trials).

Some difficulties:

- ▶  $A$  and  $B$  may be positively correlated because they have a common cause. (E.g., being a rabbit.)
- ▶ If  $B$  precedes  $A$ , then  $B$  is more likely to be the cause. (E.g., smoking.) However, they could have a common cause that induces  $B$  before  $A$ . (E.g., smart, CS70, Tesla.)

More about such questions later. For fun, check "N. Taleb: Fooled by randomness."

## Is your coin loaded?

Your coin is fair w.p.  $1/2$  or such that  $Pr[H] = 0.6$ , otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

**Analysis:**

$A =$  'coin is fair',  $B =$  'outcome is heads'

We want to calculate  $Pr[A|B]$ .

We know  $Pr[B|A] = 1/2$ ,  $Pr[B|\bar{A}] = 0.6$ ,  $Pr[A] = 1/2 = Pr[\bar{A}]$

Now,

$$\begin{aligned} Pr[B] &= Pr[A \cap B] + Pr[\bar{A} \cap B] = Pr[A]Pr[B|A] + Pr[\bar{A}]Pr[B|\bar{A}] \\ &= (1/2)(1/2) + (1/2)0.6 = 0.55. \end{aligned}$$

Thus,

$$Pr[A|B] = \frac{Pr[A]Pr[B|A]}{Pr[B]} = \frac{(1/2)(1/2)}{(1/2)(1/2) + (1/2)0.6} \approx 0.45.$$

### Is your coin loaded?

A picture:

Imagine 100 situations, among which  $m := 100(1/2)(1/2)$  are such that  $A$  and  $B$  occur and  $n := 100(1/2)(0.6)$  are such that  $\bar{A}$  and  $B$  occur.

Thus, among the  $m+n$  situations where  $B$  occurred, there are  $m$  where  $A$  occurred.

Hence,

$$Pr[A|B] = \frac{m}{m+n} = \frac{(1/2)(1/2)}{(1/2)(1/2) + (1/2)0.6}$$

### Bayes Rule

Another picture: We imagine that there are  $N$  possible causes  $A_1, \dots, A_N$ .

Imagine 100 situations, among which  $100p_nq_n$  are such that  $A_n$  and  $B$  occur, for  $n = 1, \dots, N$ .

Thus, among the  $100 \sum_m p_m q_m$  situations where  $B$  occurred, there are  $100p_nq_n$  where  $A_n$  occurred.

Hence,

$$Pr[A_n|B] = \frac{p_n q_n}{\sum_m p_m q_m}$$

### Independence

**Definition:** Two events  $A$  and  $B$  are **independent** if

$$Pr[A \cap B] = Pr[A]Pr[B].$$

Examples:

- ▶ When rolling two dice,  $A = \text{sum is 7}$  and  $B = \text{red die is 1}$  are independent;
- ▶ When rolling two dice,  $A = \text{sum is 3}$  and  $B = \text{red die is 1}$  are **not** independent;
- ▶ When flipping coins,  $A = \text{coin 1 yields heads}$  and  $B = \text{coin 2 yields tails}$  are independent;
- ▶ When throwing 3 balls into 3 bins,  $A = \text{bin 1 is empty}$  and  $B = \text{bin 2 is empty}$  are **not** independent;

### Independence and conditional probability

**Fact:** Two events  $A$  and  $B$  are **independent** if and only if

$$Pr[A|B] = Pr[A].$$

Indeed:  $Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$ , so that

$$Pr[A|B] = Pr[A] \Leftrightarrow \frac{Pr[A \cap B]}{Pr[B]} = Pr[A] \Leftrightarrow Pr[A \cap B] = Pr[A]Pr[B].$$

### Why do you have a fever?

Using Bayes' rule, we find

$$Pr[\text{Flu}|\text{High Fever}] = \frac{0.15 \times 0.80}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.58$$

$$Pr[\text{Ebola}|\text{High Fever}] = \frac{10^{-8} \times 1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 5 \times 10^{-8}$$

$$Pr[\text{Other}|\text{High Fever}] = \frac{0.85 \times 0.1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.42$$

These are the **posterior probabilities**. One says that 'Flu' is the **Most Likely a Posteriori** (MAP) cause of the high fever.

### Bayes' Rule Operations

Bayes' Rule is the canonical example of how information changes our opinions.

## Thomas Bayes

Source: Wikipedia.

## Bayes Rule.

Using Bayes' rule, we find

$$P[A|B] = \frac{0.0016 \times 0.80}{0.0016 \times 0.80 + 0.9984 \times 0.10} = .013.$$

A 1.3% chance of prostate cancer with a positive PSA test.

Surgery anyone?

Impotence...

Incontinence..

Death.

## Thomas Bayes

A Bayesian picture of Thomas Bayes.

## Summary

### Events, Conditional Probability, Independence, Bayes' Rule

Key Ideas:

- ▶ Conditional Probability:

$$Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$$

- ▶ Independence:  $Pr[A \cap B] = Pr[A]Pr[B]$ .

- ▶ Bayes' Rule:

$$Pr[A_n|B] = \frac{Pr[A_n]Pr[B|A_n]}{\sum_m Pr[A_m]Pr[B|A_m]}$$

$Pr[A_n|B]$  = posterior probability;  $Pr[A_n]$  = prior probability .

- ▶ All these are possible:

$$Pr[A|B] < Pr[A]; Pr[A|B] > Pr[A]; Pr[A|B] = Pr[A].$$

## Testing for disease.

Let's watch TV!!

Random Experiment: Pick a random male.

Outcomes: (*test*, *disease*)

*A* - prostate cancer.

*B* - positive PSA test.

- ▶  $Pr[A] = 0.0016$ , (.16 % of the male population is affected.)
- ▶  $Pr[B|A] = 0.80$  (80% chance of positive test with disease.)
- ▶  $Pr[B|\bar{A}] = 0.10$  (10% chance of positive test without disease.)

From [http://www.cpcn.org/01\\_psa\\_tests.htm](http://www.cpcn.org/01_psa_tests.htm) and

<http://seer.cancer.gov/statfacts/html/prost.html> (10/12/2011.)

Positive PSA test (*B*). Do I have disease?

$Pr[A|B]???$
