Digital Signal Processing

Lecture 15

M. Lustig, EECS UC Berkeley

1

Announcements

- Last Time

- D.T processing of C.T signals
- C.T processing of D.T signals (ha????)
 - D.T are represented as bandlimited C.T signals
 - Fractional delay
 - Resampling

- Today:

- Resampling
- Interchanging operations
 - multi-rate processing

M. Lustig, EECS UC Berkeley

2

DownSampling

- Much like C/D conversion
- Expect similar effects:
 - Aliasing
 - mitigate by antialiasing filter
- Finely sampled signal \Rightarrow almost continuous
 - Downsample in that case is like sampling!

M. Lustig, EECS UC Berkeley

3

Changing Sampling-rate via D.T Processing

$$X_d(e^{j\omega}) = \frac{1}{M} \sum_{i=0}^{M-1} X(e^{j(\omega/M - 2\pi i/M)})$$

M. Lustig, EECS UC Berkeley

4

Changing Sampling-rate via D.T Processing

$$X_d(e^{j\omega}) = \frac{1}{M} \sum_{i=0}^{M-1} X \left(e^{j(\omega/M - 2\pi i/M)} \right)$$

M. Lustig, EECS UC Berkeley

5

Anti-Aliasing

M. Lustig, EECS UC Berkeley

6

UpSampling

- Much like D/C converter
- Upsample by A LOT \Rightarrow almost continuous
- Intuition:
 - Recall our D/C model: $x[n] \Rightarrow x_s(t) \Rightarrow x_c(t)$
 - Approximate “ $x_s(t)$ ” by placing zeros between samples
 - Convolve with a sinc to obtain “ $x_c(t)$ ”

M. Lustig, EECS UC Berkeley

7

Up-sampling

$$x[n] = x_c(nT)$$

$$x_c[n] = x_c(nT^L) \text{ where } T^L = \frac{T}{L}, L \text{ integer}$$

obtain $x_c[n]$ from $x[n]$ in two steps:

$$1) \text{ Generate } x_e[n] = \begin{cases} x[n/L] & n = 0, \pm L, \pm 2L, \dots \\ 0 & \text{otherwise} \end{cases}$$

expansion

M. Lustig, EECS UC Berkeley

8

Up-Sampling

② Obtain $x_i[n]$ from $x_e[n]$ by bandlimited interpolation.

$$x_i[n] = x_e[n] * \text{sinc}\left(\frac{n}{L}\right)$$

Up-Sampling

$$x_i[n] = x_e[n] * \text{sinc}(n/L)$$

$$x_e[n] = \sum_{k=-\infty}^{\infty} x[k] \delta[n - kL]$$

$$x_i[n] = \sum_{k=-\infty}^{\infty} x[k] \text{sinc}\left(\frac{n - kL}{L}\right)$$

Frequency Domain Interpretation

$$\text{sinc}(n/L)$$

DTFT \Rightarrow

Frequency Domain Interpretation

$$\begin{aligned} X_e(e^{j\omega}) &= \sum_{k=-\infty}^{\infty} \underbrace{x_e[n]}_{\neq 0 \text{ only for } n=mL \text{ (integer } m)} e^{-j\omega n} \\ &= \sum_{m=-\infty}^{\infty} \underbrace{x_e[mL]}_{=x[m]} e^{-j\omega mL} = X(e^{j\omega L}) \end{aligned}$$

Compress DTFT by a factor of L!

Example:

M. Lustig, EECS UC Berkeley

13

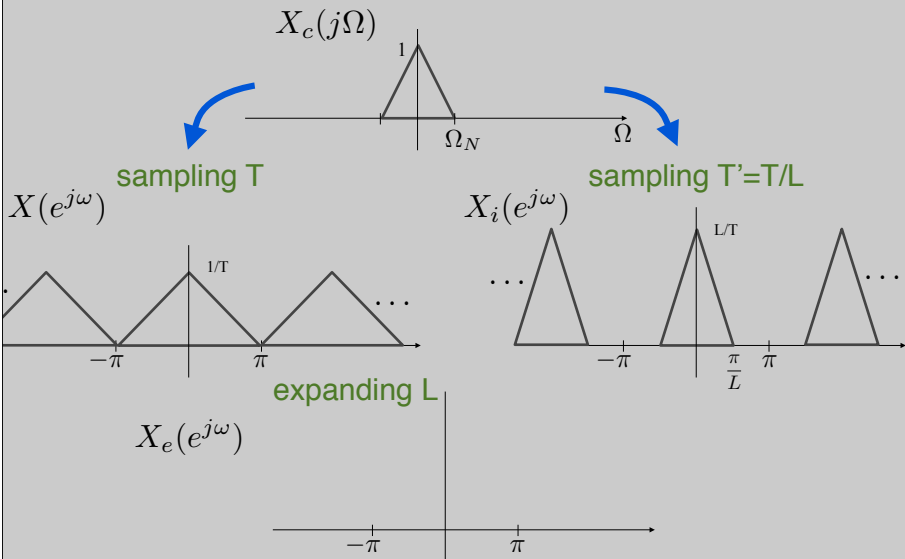

Example:

16

Example:

M. Lustig, EECS UC Berkeley

17

Practical Upsampling

- Can interpolate with simple, practical filters. See Lab!
- Example: $L=3$, linear interpolation

M. Lustig, EECS UC Berkeley

18

Resampling by non-integer

- $T' = TM/L$ (upsample L , downsample M)

Or,

- What would happen if change order?

M. Lustig, EECS UC Berkeley

19

Example:

- $L = 2, M=3, T' = 3/2T$ (fig 4.30)

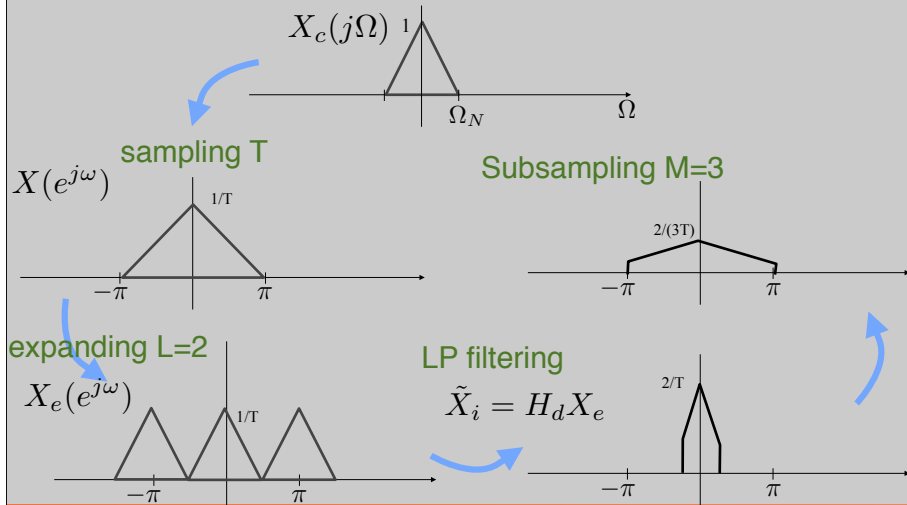

M. Lustig, EECS UC Berkeley

20

Example:

- $L = 2, M=3, T'=3/2T$ (fig 4.30)

Multi-Rate Signal Processing

- What if we want to resample by $1.01T$?
 - Expand by $L=100$
 - Filter $\pi/101$ (\$\$\$\$\$)
 - Downsample by $M=101$
- Fortunately there are ways around it!
 - Called multi-rate
 - Uses compressors, expanders and filtering

Interchanging Operations

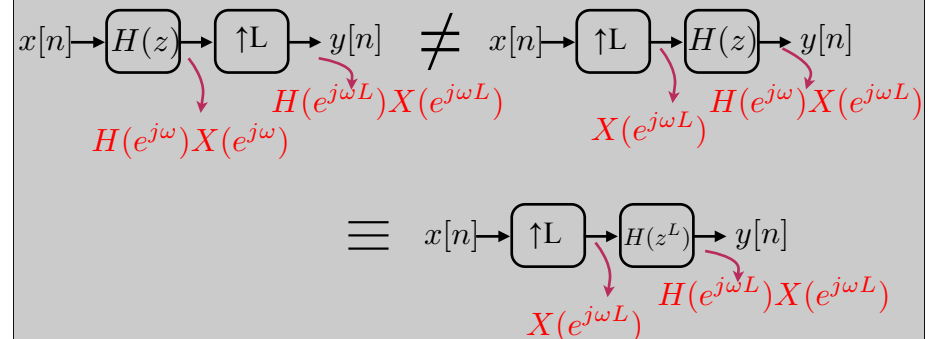

Note:

Interchanging Operations

Note:

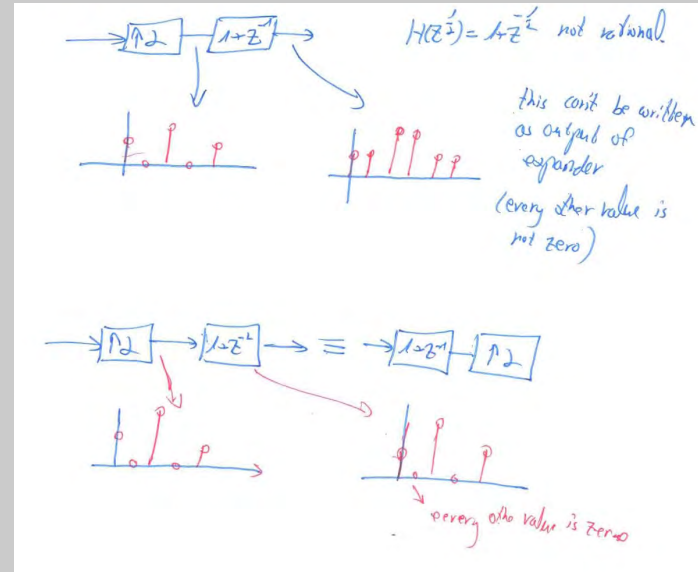

Interchanging Filter Expander

- Q: Can we move expander from Left to Right (with xform)?

- A: Yes, if $H(z)$ is rational
No, otherwise

Example:

Compressor

Claim:

Proof:

Compressor

Proof:

$$\begin{aligned}
 Y(e^{j\omega}) &= H(e^{j\omega}) \left(\sum_{i=0}^{M-1} x(e^{j(\frac{\omega}{M} - \frac{2\pi i}{M})}) \right) = \\
 &= \sum_{i=0}^{M-1} H(e^{j(\omega - 2\pi i)}) X(e^{j(\frac{\omega}{M} - \frac{2\pi i}{M})}) \\
 &= \sum_{i=0}^{M-1} H(e^{j\omega}) X(e^{j(\frac{\omega}{M} - \frac{2\pi i}{M})}) \\
 &= \sum_{i=0}^{M-1} H(e^{j\omega}) X(e^{j(\frac{\omega}{M} - \frac{2\pi i}{M})})
 \end{aligned}$$

$$V(e^{j\omega}) = H(e^{j\omega M}) X(e^{j\omega})$$

after compressor

Compressor

Claim:

$$x[n] \rightarrow \downarrow M \rightarrow H(z) \rightarrow y[n] \equiv x[n] \rightarrow H(z^M) \rightarrow \downarrow M \rightarrow \tilde{y}[n]$$

Proof:

$$\begin{aligned} Y(e^{j\omega}) &= H(e^{j\omega}) \left(\sum_{i=0}^{M-1} x(e^{j(\omega - \frac{2\pi}{M}i)}) \right) = \\ &= \sum_{i=0}^{M-1} H(e^{j(\omega - \frac{2\pi}{M}i)}) X(e^{j(\omega - \frac{2\pi}{M}i)}) \\ &= \sum_{i=0}^{M-1} \underbrace{H(e^{j\omega})}_{=H(e^{j\omega})} X(e^{j(\omega - \frac{2\pi}{M}i)}) \end{aligned}$$

$$V(e^{j\omega}) = H(e^{j\omega M}) X(e^{j\omega})$$

after compressor

Q: How compressor from right to left?
A: only if MZ^{-1} rational.

Multi-Rate Filtering

$$X(z) \rightarrow H_1(z) \rightarrow \downarrow M_1 \rightarrow H_2(z) \rightarrow \downarrow M_2 \rightarrow X_d(z)$$

$$X(z) \rightarrow [H_1(z) \downarrow M_1] \rightarrow [H_2(z) \downarrow M_2] \rightarrow X_d(z)$$

$$X(z) \rightarrow [H_1(z) H_2(z^M)] \rightarrow \downarrow M_1 M_2 \rightarrow X_d(z)$$

↑
Narrow band
very sharp filter → long impulse response.
faster to do 2 stage.
