CS10: The Beauty and Joy of Computing Artificial Intelligence

Anna Rafferty (Slides adapted from Dan Garcia) 3 April 2013

What I Do...

- · Model human learning using machine learning
- · Adaptive instruction and feedback in computerbased educational environments
- E.g., diagnose a student's knowledge by watching her play a game

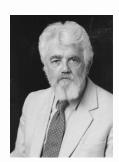

Lecture Overview

- Definition
- · Some Al history
- · Tour of areas of AI
- · Turing Test and the Chinese room

Al Definition by John McCarthy

- "Getting a computer to do things which, when done by people, are said to involve intelligence"
- Finesses the idea of whether a computer has consciousness, whether they have rights, etc.

A little history...

- Early AI (1956-early 1970s): symbolic reasoning and lots of optimism
- Neural nets (but very simple)

Person: PICK UP A BIG RED BLOCK.
Computer: OK. (does it)
Person: GRASP THE PYRAMID.
Computer: I DON'T UNDERSTAND WHICH
PYRAMID YOU MEAN.
Person: FIND A BLOCK WHICH IS TALLER
THAN THE ONE YOU ARE HOLDING AND PUT IT
INTO THE BOX.
Computer: BY "IT"; I ASSUME YOU MEAN THE
BLOCK WHICH IS TALLER THAN THE ONE I AM
HOLDING.
Computer: OK. (does it)

Computer: OK. (does it)

Clicker Question

- Which of these rules is true for all dogs?
 - (A) Has four legs
 - (B) Has fur
 - (C) Barks
 - (D) None of the above

Revival of AI

- Brittle rules break down with complexity of real world
- Probability and uncertainty
- No "dog rule" instead: what is the probability that the thing we're seeing is a dog?

What intelligent things do people do?

- Planning
- (Machine) Learning
- Natural Language Processing
- Motion and manipulation
- Perception
- Creativity
- · General Intelligence

en.wikipedia.org/wiki/Artificial_intelligence

Tour of AI Applications

- Questions to keep in mind:
 - How would you evaluate how well a machine performed on the tasks we talk about?
 - How can blending artificial and human intelligence make tasks simpler, even if the Al isn't perfect?

Planning

- · Range of intelligence
 - Low: simple heuristics
 - Medium: pathfinding
 - High: Learns from player
- Dynamic difficulty adjust to player's skill
- Allocation of resources
 - E.g., choose what land resources to give to which conservation projects

projects

Machine Learning

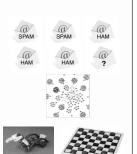

- "A program learns if, after an experience, it performs better"
- What are the right generalizations to make given the data you've seen and the task you're completing?

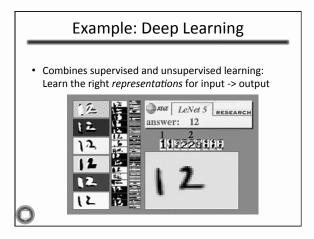

en.wikipedia.org/wiki/Machine_learning

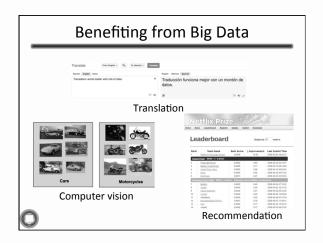

Machine Learning

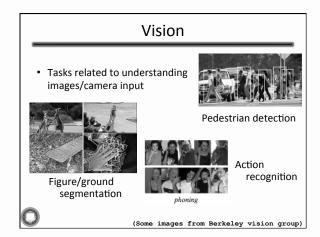

- · Algorithm Types
 - Supervised learning
 - Give a system input & output training data, and it produces a classifier
 - Unsupervised learning
 - Determine how data is organized or clustered
 - Reinforcement learning
 - No training data, realtime corrections adjust behavior

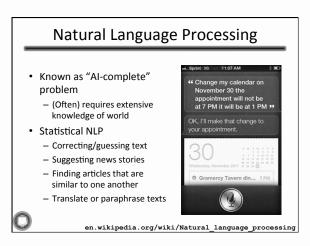

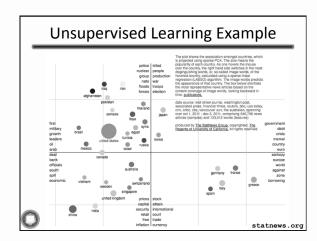

pedia.org/wiki/Machine learning

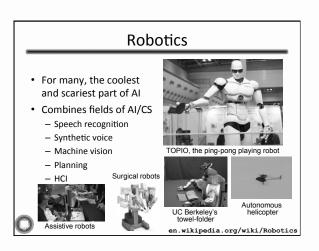

Recap

- All of these applications are tough because they require:
 - Knowing about context
 - Uncertainty about input
 - Intensive computations
- But AI has been relatively successful at making progress (and ir some cases, better thar people!)

Clicker Question

- What would a "truly intelligent" AI system look like?
 - (A) Behaves in an optimal or rational manner
 - (B) Behaves similarly to people when it makes errors, those errors are similar to people's errors
 - (C) Carries out the same type of processing (mental representations) people do – i.e., thinks like people

Turing Test for Intelligence

- In 1950, Turing defined a test of whether a machine could "think"
- "A human judge engages in a natural language conversation with one human and one machine, each of which tries to appear human. If judge can't tell, machine passes the Turing test"
- John Searle argued against the test via the Chinese room experiment, in which someone carries on a conversation by looking up phrases in a book. Does that person understand Chinese?

en.wikipedia.org/wiki/Turing_test

Clicker Question

- How would you respond to Searle's Chinese room experiment?
 - (A) The system as a whole understands Chinese
 - (B) The man doesn't understand Chinese, but if he had a way to connect with the outside world (rather than just receiving strings of symbols), he could understand Chinese
 - (C) We must be missing something about "understanding" since the argument implies that brains, which are collections of neurons, cannot understand

Summary

- Al systems excel in things computers are good at
 - Big data (using web to parse language)
 - Constrained worlds (chess, math)
- It's getting better at...
 - Language understanding
 Real-time robotics
- Lots more applications that I
- didn't have time to talk about!

 CS188: Artificial Intelligence
 - One of the most popular courses on campus!
- CogSci131: Computational Models of Cognition
