Raluca Ada Popa Spring 2018

## CS 161 Computer Security

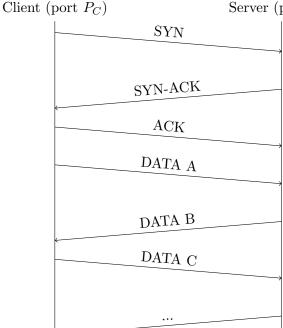

Discussion 7

## Week of March 5, 2018

Question 1 DHCP	(5 min)
opens up her laptop and	ome after a tiring day writing papers and singing karaoke. She would like to submit them to a conference. From a networking at are the steps involved in submitting her paper?
Raluca's computer need part handshake in order	s to connect to the wifi. What messages are exchanged in the 4 to achieve this?
Raluca's computer send	s:
This message is broadco	eted / unicasted. Choose one and explain:
-	with a DHCP Offer. What does this message contain? What do at this step? Keep in mind that an attacker on the same overy message.
Raluca's computer send	E
This message is broadco	sted / unicasted. Choose one and explain:
The server then respond	s with:

## Question 2 Back to L4 Basics $(10 \min)$ The transmission control protocol (TCP) and user datagram protocol (UDP) are two of the primary protocols of the Internet protocol suite. (a) How do TCP and UDP relate to IP (Internet protocol)? Which of these protocols are encapsulated within (or layered atop) one another? Could all three be used simultaneously? (b) What are the differences between TCP and UDP? Which is considered "best effort"? What does that mean?

(c) Which is easier to spoof, and why?

Server (port  $P_S$ )

- 1. Client sends initial SYN with sequence number A (usually random).
- 2. Server sends SYN-ACK with sequence number B (also usually random) and ACK A+1.
- 3. Client sends ACK with sequence number A+1 and ACK B+1.
- 4. Client sends DATA A of length  $L_A$  with sequence number A+1 and ACK B+1.
- 5. Server sends DATA B of length  $L_B$  with sequence number B+1 and ACK  $A+1+L_A$ .
- 6. Client sends DATA C of length  $L_C$  with sequence number  $A+1+L_A$  and ACK  $B+1+L_B$ .
- 7. Data exchange continues until both sides are done sending data.

Figure 1: TCP handshake and initial data transfer

## Question 3 Attack On TCP

 $(35 \min)$ 

(a) Assume that the next transmission in this connection will be DATA D from the server to the client. What will this packet look like?

Sequence number:		ACK:	
Source port:		Destination port:	
Length:	$L_D$	Flags:	None

- (b) You should be familiar with the concept and capabilities of a man-in-the-middle as an attacker who **CAN observe** and **CAN intercept** traffic. There are two other types of relevant attackers in this scenario:
  - 1. On-path attacker: CAN observe traffic but CANNOT intercept it.
  - 2. Off-path attacker: CANNOT observe traffic and CANNOT intercept it.

Carol is an *on-path* attacker. Can Carol do anything malicious to the connection? If so, what can she do?

(c)	David is an <i>off-path</i> attacker.	. Can David	do anything	malicious to $$	the connection?
	If so, what can he do?				

(d) The client starts getting responses from the server that don't make any sense. Inferring that David is attempting to hijack the connection, the client then immediately sends the server a **RST** packet, which terminates the ongoing connection. Is the client now safe?
