

# CS 188: Artificial Intelligence

## Bayes' Nets: Inference

Fall 2023 --- University of California, Berkeley

# Bayes' Nets

---

✓ Representation

✓ Conditional Independences

- Probabilistic Inference

- Enumeration (exact, exponential complexity)

- Variable elimination (exact, worst-case exponential complexity, often better)

- Probabilistic inference is NP-complete

- Sampling (approximate)

- Learning Bayes' Nets from Data

# Inference

- Inference: calculating some useful quantity from a joint probability distribution

- Examples:

- Posterior probability

$$P(Q|E_1 = e_1, \dots, E_k = e_k)$$

- Most likely explanation:

$$\operatorname{argmax}_q P(Q = q|E_1 = e_1 \dots)$$

# Inference by Enumeration

- General case:

- Evidence variables:  $E_1 \dots E_k = e_1 \dots e_k$
  - Query\* variable:  $Q$
  - Hidden variables:  $H_1 \dots H_r$
- }  $X_1, X_2, \dots, X_n$   
All variables

- We want:

$$P(Q|e_1 \dots e_k)$$

*\* Works fine with multiple query variables, too*

- Step 1: Select the entries consistent with the evidence

- Step 2: Sum out H to get joint of Query and evidence

- Step 3: Normalize

$$\times \frac{1}{Z}$$

$$P(Q, e_1 \dots e_k) = \sum_{h_1 \dots h_r} \underbrace{P(Q, h_1 \dots h_r, e_1 \dots e_k)}_{X_1, X_2, \dots, X_n}$$

$$Z = \sum_q P(Q, e_1 \dots e_k)$$

$$P(Q|e_1 \dots e_k) = \frac{1}{Z} P(Q, e_1 \dots e_k)$$

# Inference by Enumeration in Bayes' Net

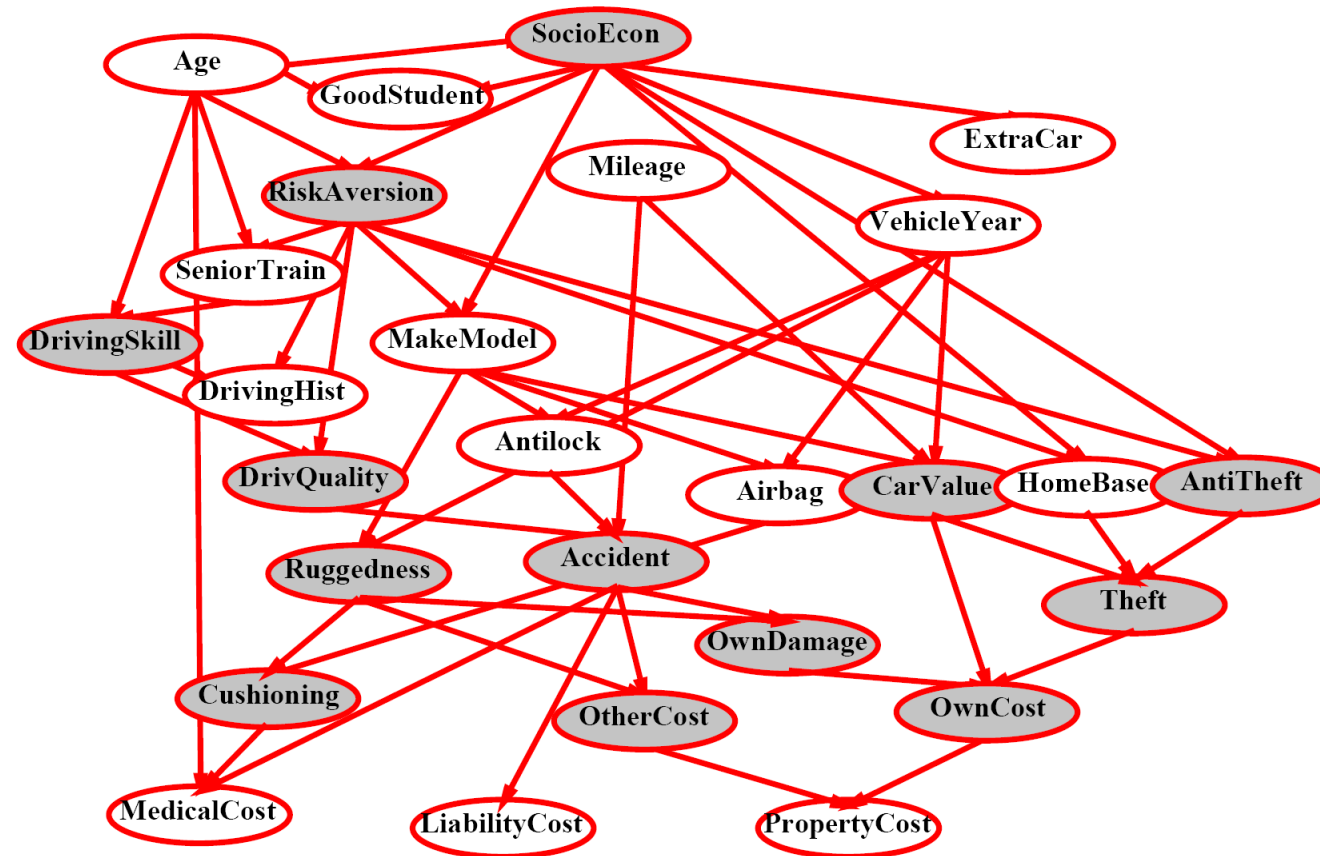

- Given unlimited time, inference in BNs is easy
- Reminder of inference by enumeration by example:

$$\begin{aligned}P(B \mid +j, +m) &\propto_B P(B, +j, +m) \\&= \sum_{e,a} P(B, e, a, +j, +m) \\&= \sum_{e,a} P(B)P(e)P(a|B, e)P(+j|a)P(+m|a)\end{aligned}$$

$$\begin{aligned}=&P(B)P(+e)P(+a|B, +e)P(+j| + a)P(+m| + a) + P(B)P(+e)P(-a|B, +e)P(+j| - a)P(+m| - a) \\&P(B)P(-e)P(+a|B, -e)P(+j| + a)P(+m| + a) + P(B)P(-e)P(-a|B, -e)P(+j| - a)P(+m| - a)\end{aligned}$$

# Inference by Enumeration?

# Inference by Enumeration vs. Variable Elimination

- Why is inference by enumeration so slow?
  - You join up the whole joint distribution before you sum out the hidden variables

- Idea: interleave joining and marginalizing!
  - Called “Variable Elimination”
  - Still NP-hard, but usually much faster than inference by enumeration

- First we'll need some new notation: factors

# Factor Zoo

# Factor Zoo I

- Joint distribution:  $P(X,Y)$ 
  - Entries  $P(x,y)$  for all  $x, y$
  - Sums to 1
- Selected joint:  $P(x,Y)$ 
  - A slice of the joint distribution
  - Entries  $P(x,y)$  for fixed  $x$ , all  $y$
  - Sums to  $P(x)$
- Number of capitals = dimensionality of the table

$P(T, W)$

T	W	P
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

$P(\text{cold}, W)$

T	W	P
cold	sun	0.2
cold	rain	0.3

# Factor Zoo II

- Single conditional:  $P(Y | x)$ 
  - Entries  $P(y | x)$  for fixed  $x$ , all
  - Sums to 1

$$P(W|cold)$$

T	W	P
cold	sun	0.4
cold	rain	0.6

- Family of conditionals:  $P(Y | X)$

- Multiple conditionals
- Entries  $P(y | x)$  for all  $x, y$
- Sums to  $|X|$

$$P(W|T)$$

T	W	P
hot	sun	0.8
hot	rain	0.2
cold	sun	0.4
cold	rain	0.6

$$P(W|hot)$$

$$P(W|cold)$$

# Factor Zoo III

- Specified family:  $P(y | X)$ 
  - Entries  $P(y | x)$  for fixed  $y$ , but for all  $x$
  - Sums to ... who knows!

$$P(\text{rain}|T)$$

T	W	P
hot	rain	0.2
cold	rain	0.6

$$P(\text{rain}|hot)$$

$$P(\text{rain}|cold)$$

# Factor Zoo Summary

- In general, when we write  $P(Y_1 \dots Y_N \mid X_1 \dots X_M)$ 
  - It is a “factor,” a multi-dimensional array
  - Its values are  $P(y_1 \dots y_N \mid x_1 \dots x_M)$
  - Any assigned (=lower-case) X or Y is a dimension missing (selected) from the array

# Example: Traffic Domain

- Random Variables

- R: Raining
- T: Traffic
- L: Late for class!

$$P(L) = ?$$

$$= \sum_{r,t} P(r, t, L)$$

$$= \sum_{r,t} P(r)P(t|r)P(L|t)$$

$$P(R)$$

+r	0.1
-r	0.9

$$P(T|R)$$

+r	+t	0.8
+r	-t	0.2
-r	+t	0.1
-r	-t	0.9

$$P(L|T)$$

+t	+l	0.3
+t	-l	0.7
-t	+l	0.1
-t	-l	0.9

# Variable Elimination (VE)

# Inference by Enumeration: Procedural Outline

- Track objects called **factors**
- Initial factors are local CPTs (one per node)

$$P(R)$$

+r	0.1
-r	0.9

$$P(T|R)$$

+r	+t	0.8
+r	-t	0.2
-r	+t	0.1
-r	-t	0.9

$$P(L|T)$$

+t	+l	0.3
+t	-l	0.7
-t	+l	0.1
-t	-l	0.9

- Any known values are selected
  - E.g. if we know  $L = +l$ , the initial factors are

$$P(R)$$

+r	0.1
-r	0.9

$$P(T|R)$$

+r	+t	0.8
+r	-t	0.2
-r	+t	0.1
-r	-t	0.9

$$P(+l|T)$$

+t	+l	0.3
-t	+l	0.1

- Procedure: Join all factors, eliminate all hidden variables, normalize

# Operation 1: Join Factors

- First basic operation: **joining factors**
- Combining factors:
  - Just like a database join**
  - Get all factors over the joining variable
  - Build a new factor over the union of the variables involved

- Example: Join on R

- Computation for each entry: pointwise products  $\forall r, t : P(r, t) = P(r) \cdot P(t|r)$

# Example: Multiple Joins

# Example: Multiple Joins

$P(R)$

+r	0.1
-r	0.9

$P(T|R)$

+r	+t	0.8
+r	-t	0.2
-r	+t	0.1
-r	-t	0.9

$P(L|T)$

+t	+l	0.3
+t	-l	0.7
-t	+l	0.1
-t	-l	0.9

Join R

$P(R, T)$

+r	+t	0.08
+r	-t	0.02
-r	+t	0.09
-r	-t	0.81

$P(L|T)$

+t	+l	0.3
+t	-l	0.7
-t	+l	0.1
-t	-l	0.9

Join T

$R, T, L$

$P(R, T, L)$

+r	+t	+l	0.024
+r	+t	-l	0.056
+r	-t	+l	0.002
+r	-t	-l	0.018
-r	+t	+l	0.027
-r	+t	-l	0.063
-r	-t	+l	0.081
-r	-t	-l	0.729

# Operation 2: Eliminate

- Second basic operation: **marginalization**
- Take a factor and sum out a variable
  - Shrinks a factor to a smaller one
  - A **projection** operation
- Example:

$$P(R, T)$$

+r	+t	0.08
+r	-t	0.02
-r	+t	0.09
-r	-t	0.81

sum  $R$

$$P(T)$$

+t	0.17
-t	0.83

# Multiple Elimination

# Thus Far: Multiple Join, Multiple Eliminate (= Inference by Enumeration)

# Marginalizing Early (= Variable Elimination)

# Traffic Domain

$$P(L) = ?$$

- Inference by Enumeration

$$= \sum_t \sum_r \underbrace{P(L|t)P(r)P(t|r)}_{\text{Join on } r} \underbrace{\phantom{P(L|t)P(r)P(t|r)}}_{\text{Join on } t} \underbrace{\phantom{P(L|t)P(r)P(t|r)}}_{\text{Eliminate } r} \underbrace{\phantom{P(L|t)P(r)P(t|r)}}_{\text{Eliminate } t}$$

- Variable Elimination

$$= \sum_t P(L|t) \underbrace{\sum_r P(r)P(t|r)}_{\text{Join on } r} \underbrace{\phantom{\sum_r P(r)P(t|r)}}_{\text{Eliminate } r} \underbrace{\phantom{\sum_r P(r)P(t|r)}}_{\text{Join on } t} \underbrace{\phantom{\sum_r P(r)P(t|r)}}_{\text{Eliminate } t}$$

# Marginalizing Early! (aka VE)

# Evidence

- If evidence, start with factors that select that evidence
  - No evidence uses these initial factors:

$$P(R)$$

+r	0.1
-r	0.9

$$P(T|R)$$

+r	+t	0.8
+r	-t	0.2
-r	+t	0.1
-r	-t	0.9

$$P(L|T)$$

+t	+l	0.3
+t	-l	0.7
-t	+l	0.1
-t	-l	0.9

- Computing  $P(L|+r)$  the initial factors become:

$$P(+r)$$

+r	0.1
----	-----

$$P(T|+r)$$

+r	+t	0.8
+r	-t	0.2

$$P(L|T)$$

+t	+l	0.3
+t	-l	0.7
-t	+l	0.1
-t	-l	0.9

- We eliminate all vars other than query + evidence

# Evidence II

- Result will be a selected joint of query and evidence
  - E.g. for  $P(L \mid +r)$ , we would end up with:

$$P(+r, L)$$

+r	+l	0.026
+r	-l	0.074

Normalize

$$P(L \mid +r)$$

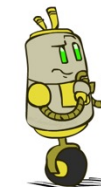

+l	0.26
-l	0.74

- To get our answer, just normalize this!
- That's it!

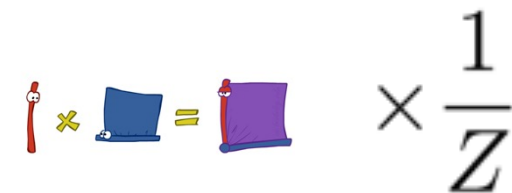

# General Variable Elimination

- Query:  $P(Q|E_1 = e_1, \dots, E_k = e_k)$
- Start with initial factors:
  - Local CPTs (but instantiated by evidence)
- While there are still hidden variables (not Q or evidence):
  - Pick a hidden variable H
  - Join all factors mentioning H
  - Eliminate (sum out) H
- Join all remaining factors and normalize

x	P(x)
-3	0.05
-1	0.25
0	0.07
1	0.2
5	0.01

$$\text{stick} \times \text{blue square} = \text{purple square} \times \frac{1}{Z}$$

# Example

$$P(B|j, m) \propto P(B, j, m)$$

$P(B)$	$P(E)$	$P(A B, E)$	$P(j A)$	$P(m A)$
--------	--------	-------------	----------	----------

Choose A

$$P(A|B, E)$$

$$P(j|A)$$

$$P(m|A)$$

$$P(j, m, A|B, E)$$

$$P(j, m|B, E)$$

$P(B)$	$P(E)$	$P(j, m B, E)$
--------	--------	----------------

# Example

$$P(B) \quad P(E) \quad P(j, m|B, E)$$

Choose E

$$\begin{array}{l} P(E) \\ P(j, m|B, E) \end{array} \xrightarrow{\times} P(j, m, E|B) \xrightarrow{\Sigma} P(j, m|B)$$

$$P(B) \quad P(j, m|B)$$

Finish with B

$$\begin{array}{l} P(B) \\ P(j, m|B) \end{array} \xrightarrow{\times} P(j, m, B) \xrightarrow{\text{Normalize}} P(B|j, m)$$

# Same Example in Equations

$$P(B|j, m) \propto P(B, j, m)$$

$P(B)$	$P(E)$	$P(A B, E)$	$P(j A)$	$P(m A)$
--------	--------	-------------	----------	----------

$$\begin{aligned}
 P(B|j, m) &\propto P(B, j, m) \\
 &= \sum_{e, a} P(B, j, m, e, a) \\
 &= \sum_{e, a} P(B)P(e)P(a|B, e)P(j|a)P(m|a) \\
 &= \sum_e P(B)P(e) \sum_a P(a|B, e)P(j|a)P(m|a) \\
 &= \sum_e P(B)P(e)f_1(B, e, j, m) \\
 &= P(B) \sum_e P(e)f_1(B, e, j, m) \\
 &= P(B)f_2(B, j, m)
 \end{aligned}$$

marginal obtained from joint by summing out

use Bayes' net joint distribution expression

use  $x*(y+z) = xy + xz$

joining on a, and then summing out gives  $f_1$

use  $x*(y+z) = xy + xz$

joining on e, and then summing out gives  $f_2$

All we are doing is exploiting  $uwv + uwz + uxy + uxz + vwy + vwz + vxy + vxz = (u+v)(w+x)(y+z)$  to improve computational efficiency!

# Another Variable Elimination Example

Query:  $P(X_3|Y_1 = y_1, Y_2 = y_2, Y_3 = y_3)$

Start by inserting evidence, which gives the following initial factors:

$$p(Z)p(X_1|Z)p(X_2|Z)p(X_3|Z)p(y_1|X_1)p(y_2|X_2)p(y_3|X_3)$$

Eliminate  $X_1$ , this introduces the factor  $f_1(Z, y_1) = \sum_{x_1} p(x_1|Z)p(y_1|x_1)$ , and we are left with:

$$p(Z)f_1(Z, y_1)p(X_2|Z)p(X_3|Z)p(y_2|X_2)p(y_3|X_3)$$

Eliminate  $X_2$ , this introduces the factor  $f_2(Z, y_2) = \sum_{x_2} p(x_2|Z)p(y_2|x_2)$ , and we are left with:

$$p(Z)f_1(Z, y_1)f_2(Z, y_2)p(X_3|Z)p(y_3|X_3)$$

Eliminate  $Z$ , this introduces the factor  $f_3(y_1, y_2, X_3) = \sum_z p(z)f_1(z, y_1)f_2(z, y_2)p(X_3|z)$ , and we are left:

$$p(y_3|X_3), f_3(y_1, y_2, X_3)$$

No hidden variables left. Join the remaining factors to get:

$$f_4(y_1, y_2, y_3, X_3) = P(y_3|X_3)f_3(y_1, y_2, X_3).$$

Normalizing over  $X_3$  gives  $P(X_3|y_1, y_2, y_3)$ .

Computational complexity critically depends on the largest factor being generated in this process. Size of factor = number of entries in table. In example above (assuming binary) all factors generated are of size 2 --- as they all only have one variable ( $Z$ ,  $Z$ , and  $X_3$  respectively).

# Variable Elimination Ordering

- For the query  $P(X_n | y_1, \dots, y_n)$  work through the following two different orderings as done in previous slide:  $Z, X_1, \dots, X_{n-1}$  and  $X_1, \dots, X_{n-1}, Z$ . What is the size of the maximum factor generated for each of the orderings?

- Answer:  $2^{n+1}$  versus  $2^2$  (assuming binary)
- In general: the ordering can greatly affect efficiency.

# VE: Computational and Space Complexity

---

- The computational and space complexity of variable elimination is determined by the largest factor
- The elimination ordering can greatly affect the size of the largest factor.
  - E.g., previous slide's example  $2^n$  vs. 2
- Does there always exist an ordering that only results in small factors?
  - **No!**

# Worst Case Complexity?

- CSP:

$$(x_1 \vee x_2 \vee \neg x_3) \wedge (\neg x_1 \vee x_3 \vee \neg x_4) \wedge (x_2 \vee \neg x_2 \vee x_4) \wedge (\neg x_3 \vee \neg x_4 \vee \neg x_5) \wedge (x_2 \vee x_5 \vee x_7) \wedge (x_4 \vee x_5 \vee x_6) \wedge (\neg x_5 \vee x_6 \vee \neg x_7) \wedge (\neg x_5 \vee \neg x_6 \vee x_7)$$

$$P(X_i = 0) = P(X_i = 1) = 0.5$$

$$Y_1 = X_1 \vee X_2 \vee \neg X_3$$

...

$$Y_8 = \neg X_5 \vee X_6 \vee X_7$$

$$Y_{1,2} = Y_1 \wedge Y_2$$

...

$$Y_{7,8} = Y_7 \wedge Y_8$$

$$Y_{1,2,3,4} = Y_{1,2} \wedge Y_{3,4}$$

$$Y_{5,6,7,8} = Y_{5,6} \wedge Y_{7,8}$$

$$Z = Y_{1,2,3,4} \wedge Y_{5,6,7,8}$$

- If we can answer  $P(z)$  equal to zero or not, we answered whether the 3-SAT problem has a solution.
- Hence inference in Bayes' nets is NP-hard. No known efficient probabilistic inference in general.

# Polytrees

---

- A polytree is a directed graph with no undirected cycles
- For poly-trees you can always find an ordering that is efficient
  - Try it!!
- Cut-set conditioning for Bayes' net inference
  - Choose set of variables such that if removed only a polytree remains
  - Exercise: Think about how the specifics would work out!

# Bayes' Nets

---

- ✓ Representation
- ✓ Conditional Independences
- Probabilistic Inference
  - ✓ Enumeration (exact, exponential complexity)
  - ✓ Variable elimination (exact, worst-case exponential complexity, often better)
  - ✓ Inference is NP-complete
    - Sampling (approximate)
- Learning Bayes' Nets from Data
