## Regular Discussion 8

## 1 HMMs

Consider the following Hidden Markov Model.  $O_1$  and  $O_2$  are supposed to be shaded.

| (w.)  | $-(w_{2})$             |       |          | $W_t$ | $W_{t+1}$ | $P(W_{t+1} W_t)$ | $W_t$ | $O_t$ | $P(O_t W_t)$ |
|-------|------------------------|-------|----------|-------|-----------|------------------|-------|-------|--------------|
|       |                        | $W_1$ | $P(W_1)$ | 0     | 0         | 0.4              | 0     | a     | 0.9          |
|       |                        | 0     | 0.3      | 0     | 1         | 0.6              | 0     | b     | 0.1          |
|       |                        | 1     | 0.7      | 1     | 0         | 0.8              | 1     | a     | 0.5          |
| $O_1$ | $\left( O_{2} \right)$ |       |          | 1     | 1         | 0.2              | 1     | b     | 0.5          |

Suppose that we observe  $O_1 = a$  and  $O_2 = b$ . Using the forward algorithm, compute the probability distribution  $P(W_2|O_1 = a, O_2 = b)$  one step at a time.

(a) Compute  $P(W_1, O_1 = a)$ .

(b) Using the previous calculation, compute  $P(W_2, O_1 = a)$ .

(c) Using the previous calculation, compute  $P(W_2, O_1 = a, O_2 = b)$ .

(d) Finally, compute  $P(W_2|O_1 = a, O_2 = b)$ .

## 2 Particle Filtering

Let's use Particle Filtering to estimate the distribution of  $P(W_2|O_1 = a, O_2 = b)$ . Here's the HMM again.  $O_1$  and  $O_2$  are supposed to be shaded.

| $(W_1) \rightarrow (W_2)$ |       |          | $W_t$ | $W_{t+1}$ | $P(W_{t+1} W_t)$ | [ | $W_t$ | $O_t$ | $P(O_t W_t)$ |
|---------------------------|-------|----------|-------|-----------|------------------|---|-------|-------|--------------|
|                           | $W_1$ | $P(W_1)$ | 0     | 0         | 0.4              | Ì | 0     | a     | 0.9          |
|                           | 0     | 0.3      | 0     | 1         | 0.6              |   | 0     | b     | 0.1          |
|                           | 1     | 0.7      | 1     | 0         | 0.8              |   | 1     | a     | 0.5          |
| $(O_1)$ $(O_2)$           |       |          | 1     | 1         | 0.2              |   | 1     | b     | 0.5          |

We start with two particles representing our distribution for  $W_1$ .  $P_1: W_1 = 0$   $P_2: W_1 = 1$ Use the following random numbers to run particle filtering:

[0.22, 0.05, 0.33, 0.20, 0.84, 0.54, 0.79, 0.66, 0.14, 0.96]

(a) **Observe**: Compute the weight of the two particles after evidence  $O_1 = a$ .

(b) Resample: Using the random numbers, resample  $P_1$  and  $P_2$  based on the weights.

(c) **Predict**: Sample  $P_1$  and  $P_2$  from applying the time update.

(d) Update: Compute the weight of the two particles after evidence  $O_2 = b$ .

(e) Resample: Using the random numbers, resample  $P_1$  and  $P_2$  based on the weights.

(f) What is our estimated distribution for  $P(W_2|O_1 = a, O_2 = b)$ ?
