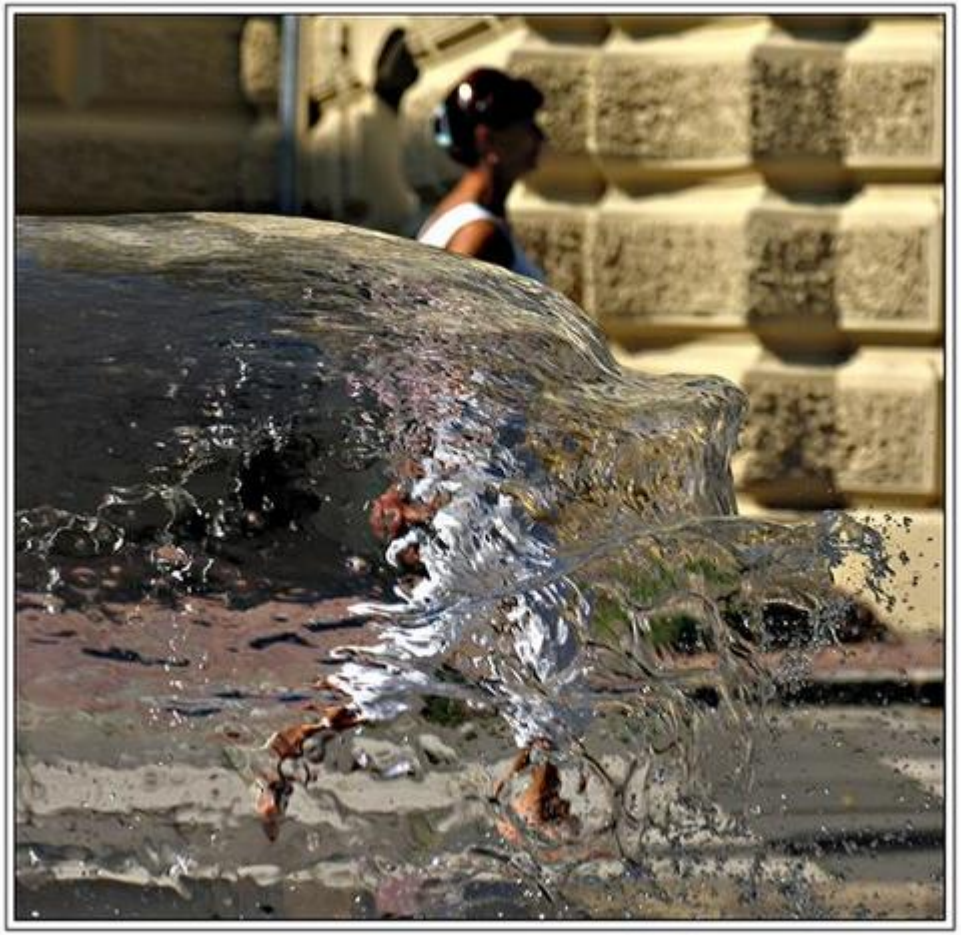
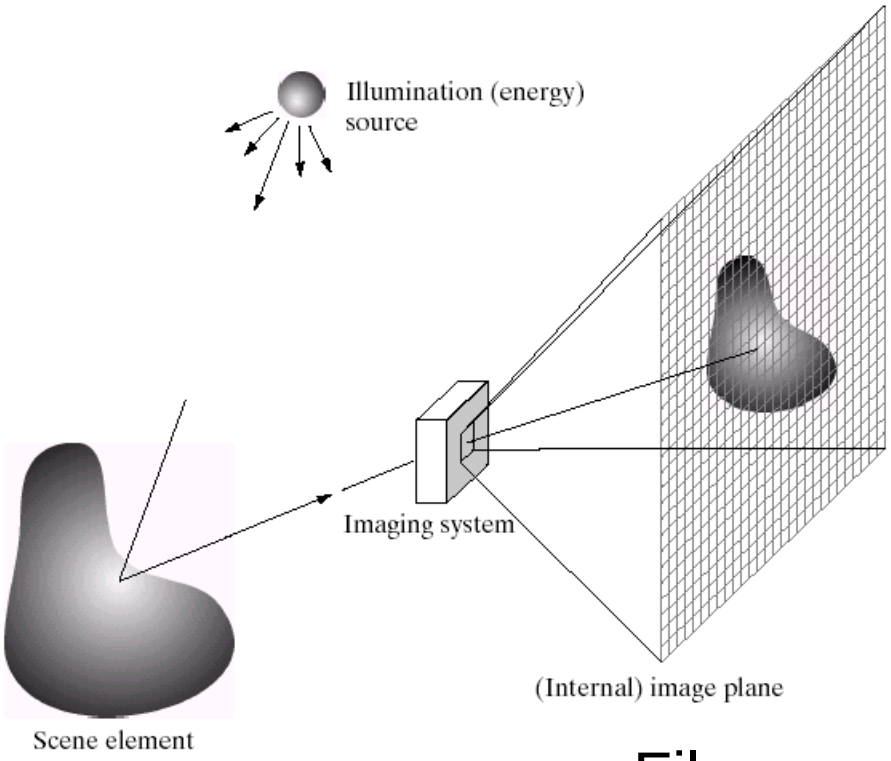
The Camera

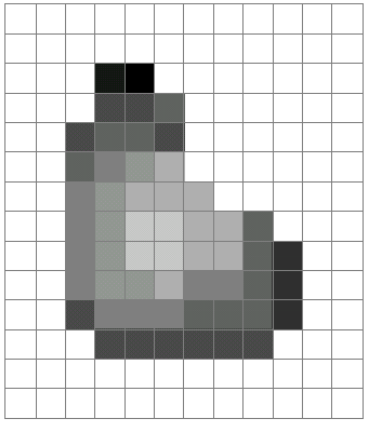


CS194: Intro to Comp. Vision, and Comp. Photo
Alexei Efros, UC Berkeley, Fall 2022

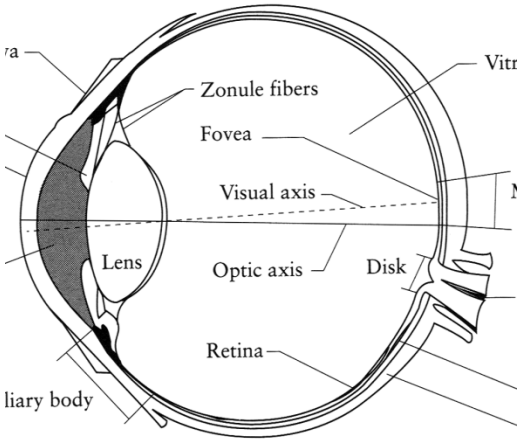
Image Formation



Film

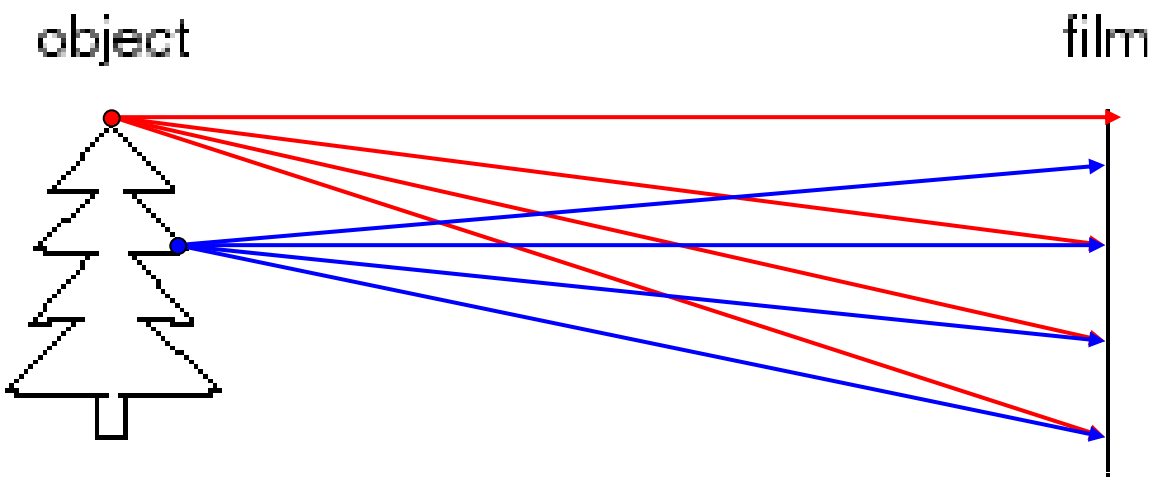


Digital Camera



The Eye

How do we see the world?

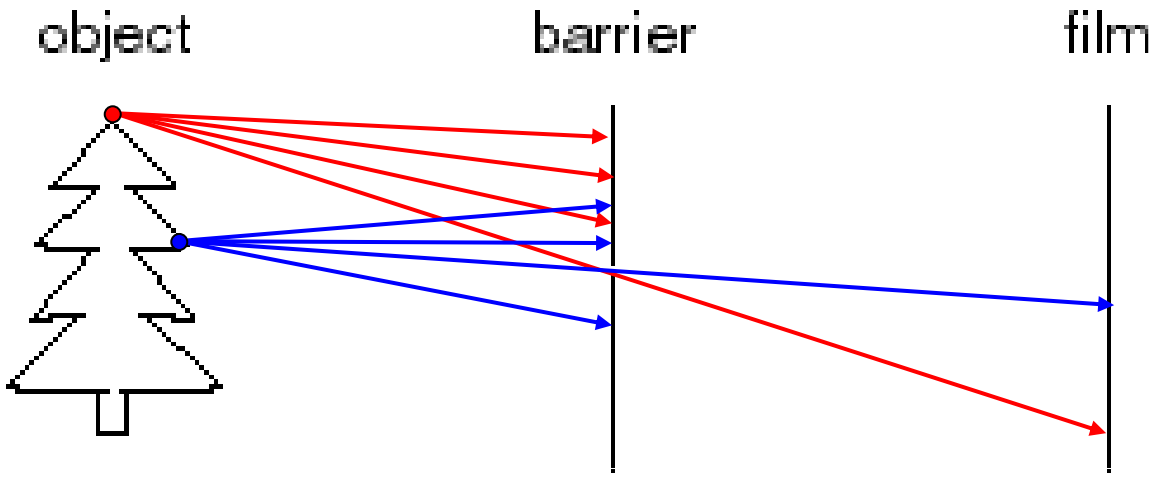


Let’s design a camera

- Idea 1: put a piece of film in front of an object
- Do we get a reasonable image?

Slide by Steve Seitz

Pinhole camera



Add a barrier to block off most of the rays

- This reduces blurring
- The opening known as the **aperture**
- How does this transform the image?

Slide by Steve Seitz

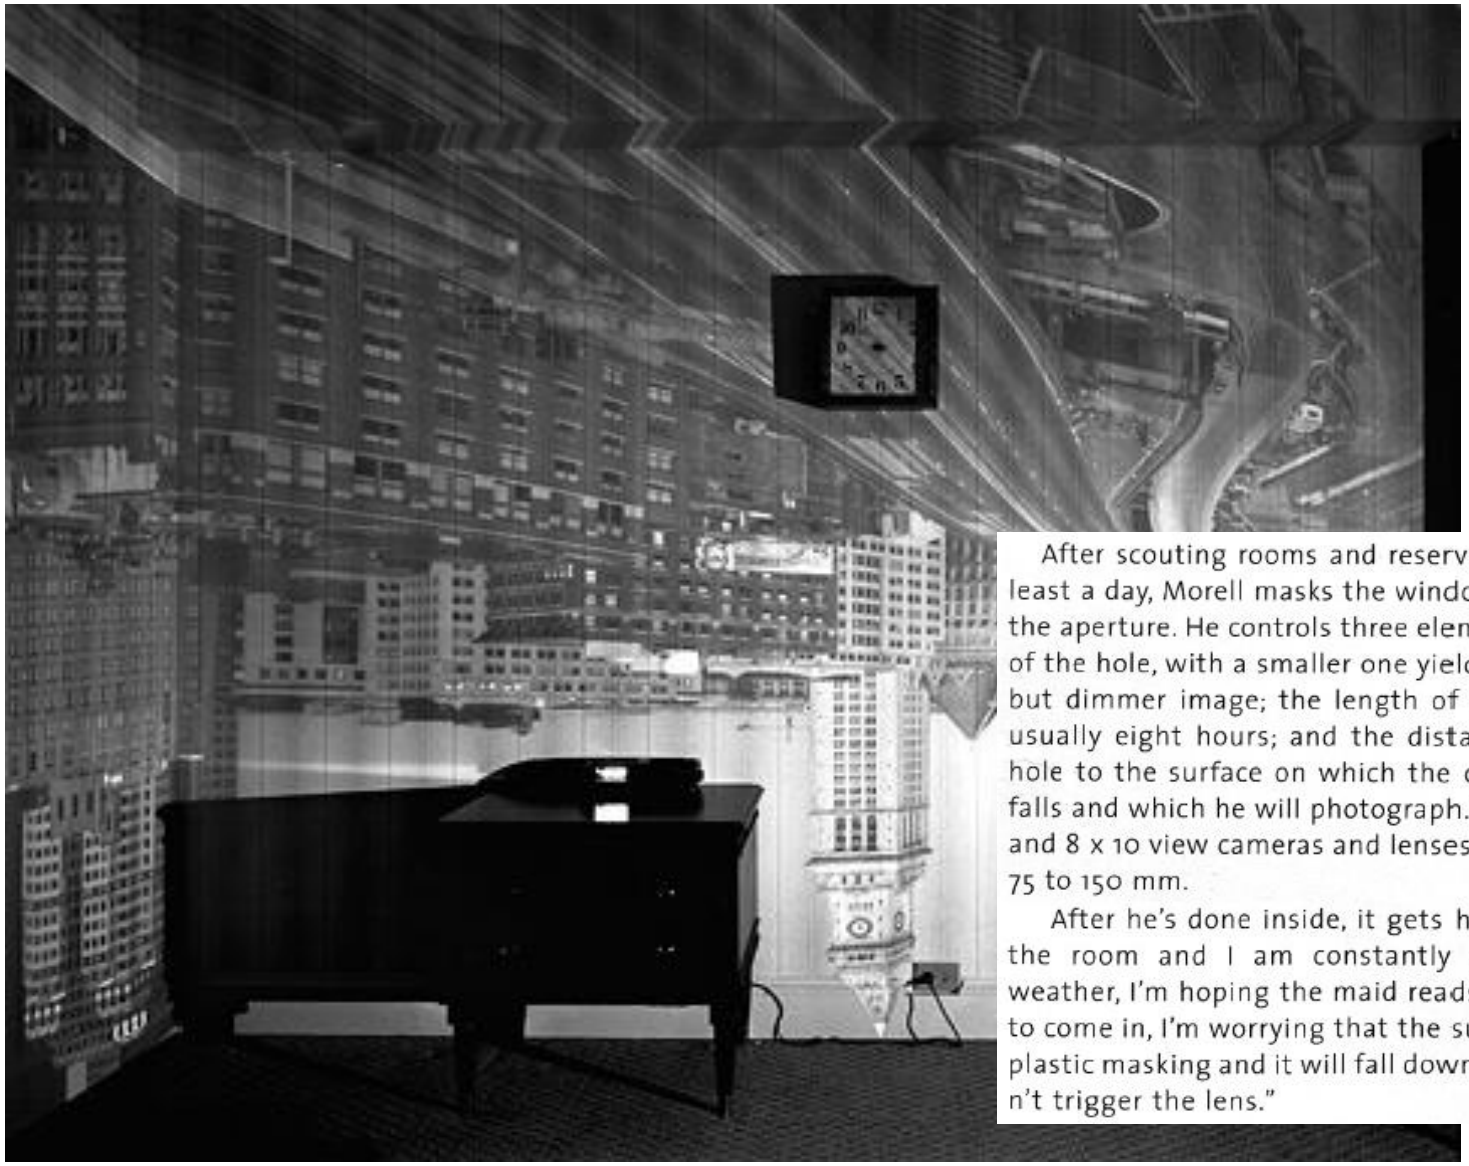
Camera Obscura: the pre-camera

- First Idea: Mo-Ti, China (470-390 BC)
- First build: Al Hacen, Iraq/Egypt (965-1039 AD)

Drawing aid for artists: described by Leonardo da Vinci (1452-1519)

Camera Obscura near Cliff House

8-hour exposure (Abelardo Morell)



After scouting rooms and reserving one for at least a day, Morell masks the windows except for the aperture. He controls three elements: the size of the hole, with a smaller one yielding a sharper but dimmer image; the length of the exposure, usually eight hours; and the distance from the hole to the surface on which the outside image falls and which he will photograph. He used 4 x 5 and 8 x 10 view cameras and lenses ranging from 75 to 150 mm.

After he's done inside, it gets harder. "I leave the room and I am constantly checking the weather, I'm hoping the maid reads my note not to come in, I'm worrying that the sun will hit the plastic masking and it will fall down, or that I didn't trigger the lens."

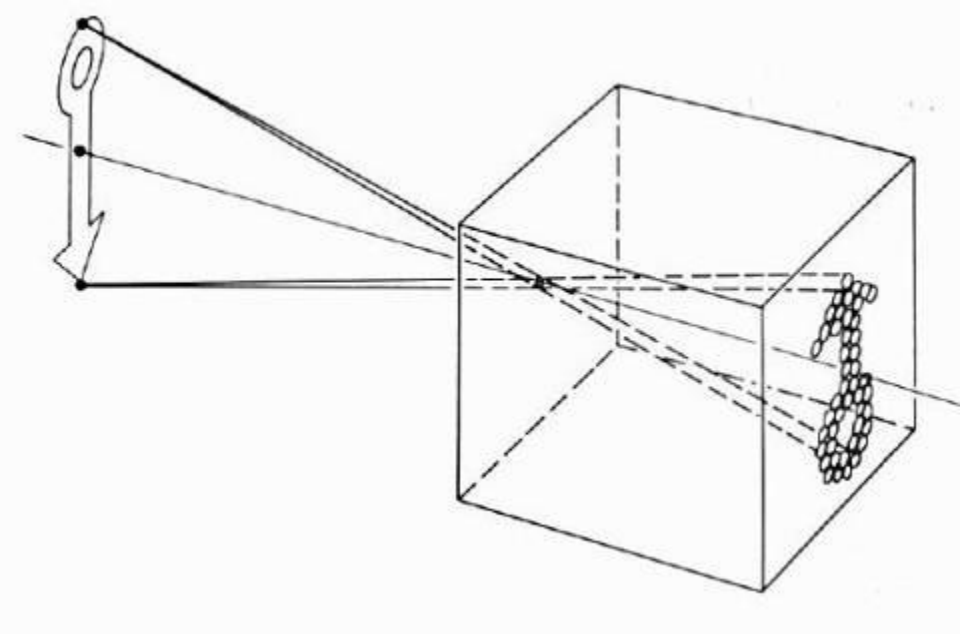
Pinhole camera model

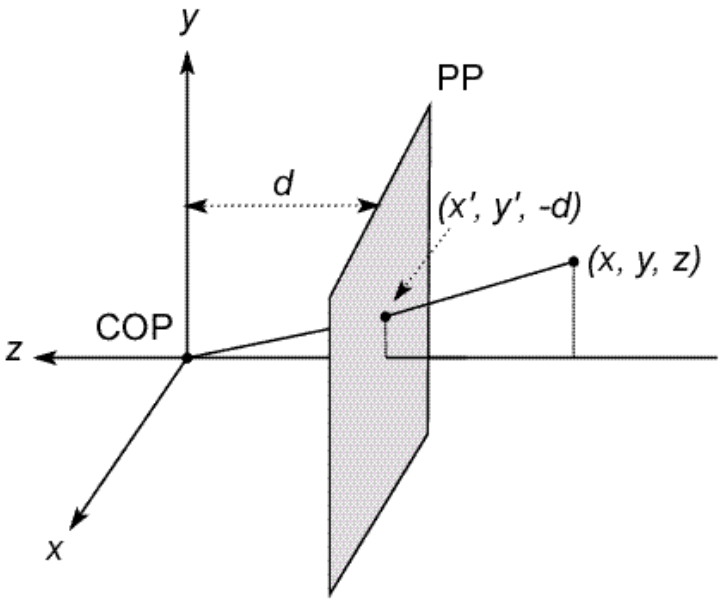


Pinhole model:

- Captures **pencil of rays** – all rays through a single point
- The point is called **Center of Projection (COP)**
- The image is formed on the **Image Plane**
- **Effective focal length *d*** is distance from COP to Image Plane

Slide by Steve Seitz

Modeling projection

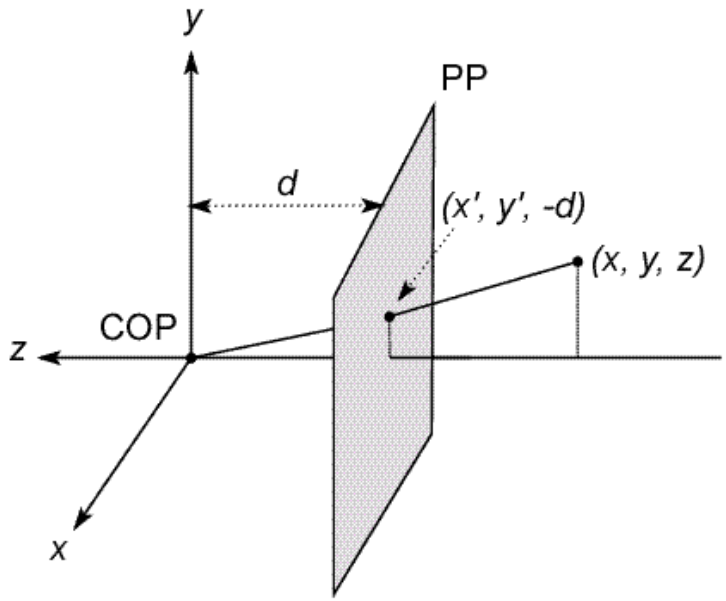


The coordinate system

- We will use the pin-hole model as an approximation
- Put the optical center (**C**enter **O**f **P**rojection) at the origin
- Put the image plane (**P**rojection **P**lane) *in front* of the COP
  - = Why?
- The camera looks down the *negative* z axis
  - – we need this if we want right-handed-coordinates

Slide by Steve Seitz

Modeling projection



Projection equations

- Compute intersection with PP of ray from (x,y,z) to COP
- Derived using similar triangles (on board)

$$(x, y, z) \rightarrow (-d\frac{x}{z}, \ -d\frac{y}{z}, \ -d)$$

- We get the projection by throwing out the last coordinate:

$$(x, y, z) \rightarrow (-d\frac{x}{z}, \ -d\frac{y}{z})$$

Point of observation

2D image

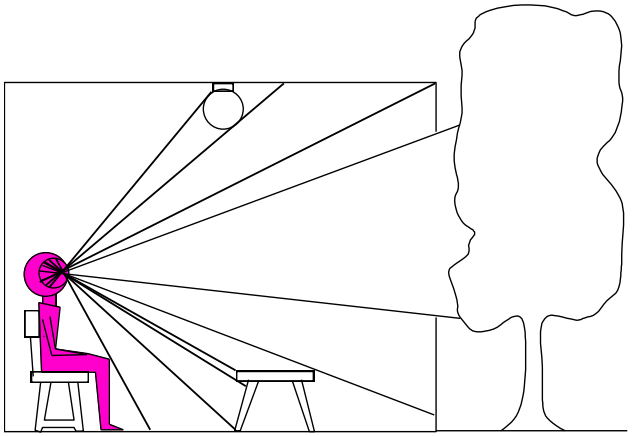
Why did evolution opt for such strange solution?

- Nice to have a passive, long-range sensor
- Can get 3D with stereo or by moving around, plus experience

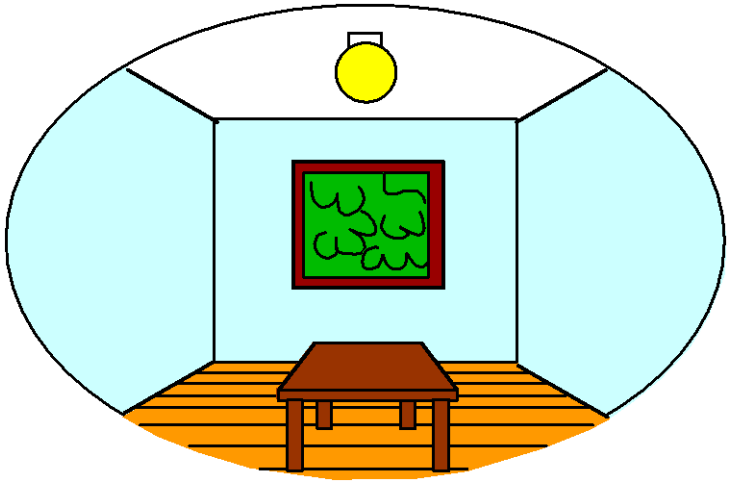
Dimensionality Reduction Machine (3D to 2D)

3D world



Point of observation

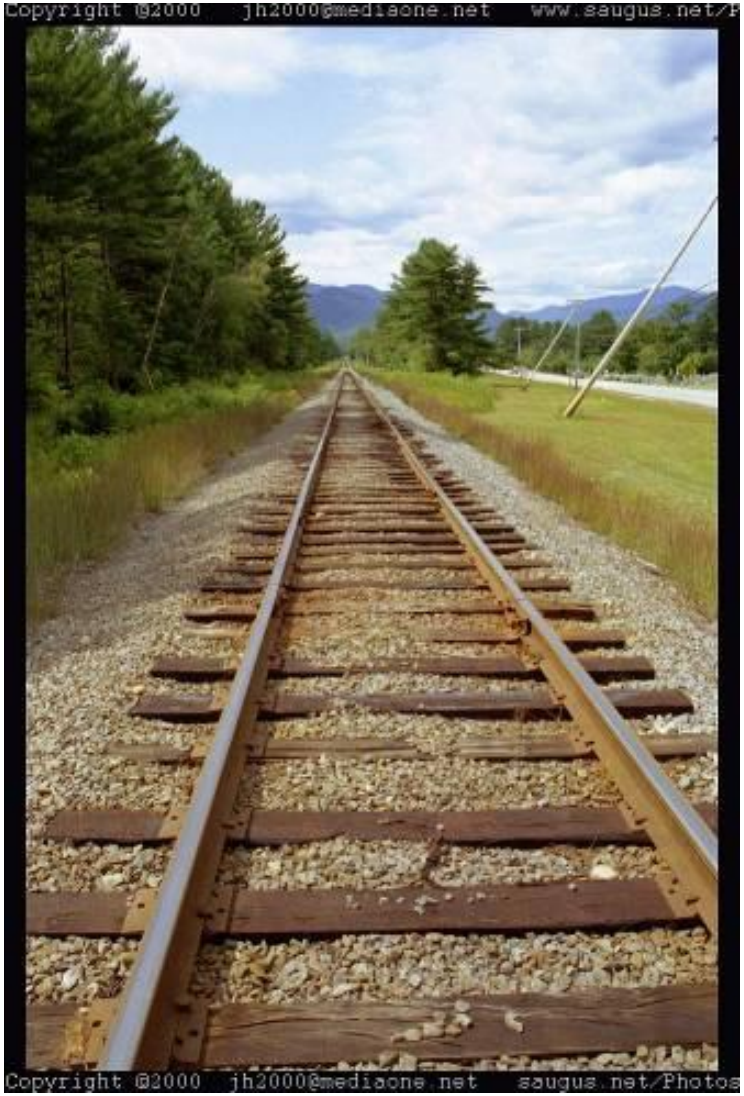
2D image



What have we lost?

- Angles
- Distances (lengths)

Funny things happen…



Parallel lines aren’t…

Study: People Far Away From You Not Actually Smaller

NEWS • Science & Technology • ISSUE 49•34 • Aug 22, 2013

Researchers say that, contrary to prior assertions, the subject above stands at equal height at left and at right, and does not grow smaller as he walks away from the camera.

Lengths can’t be trusted...

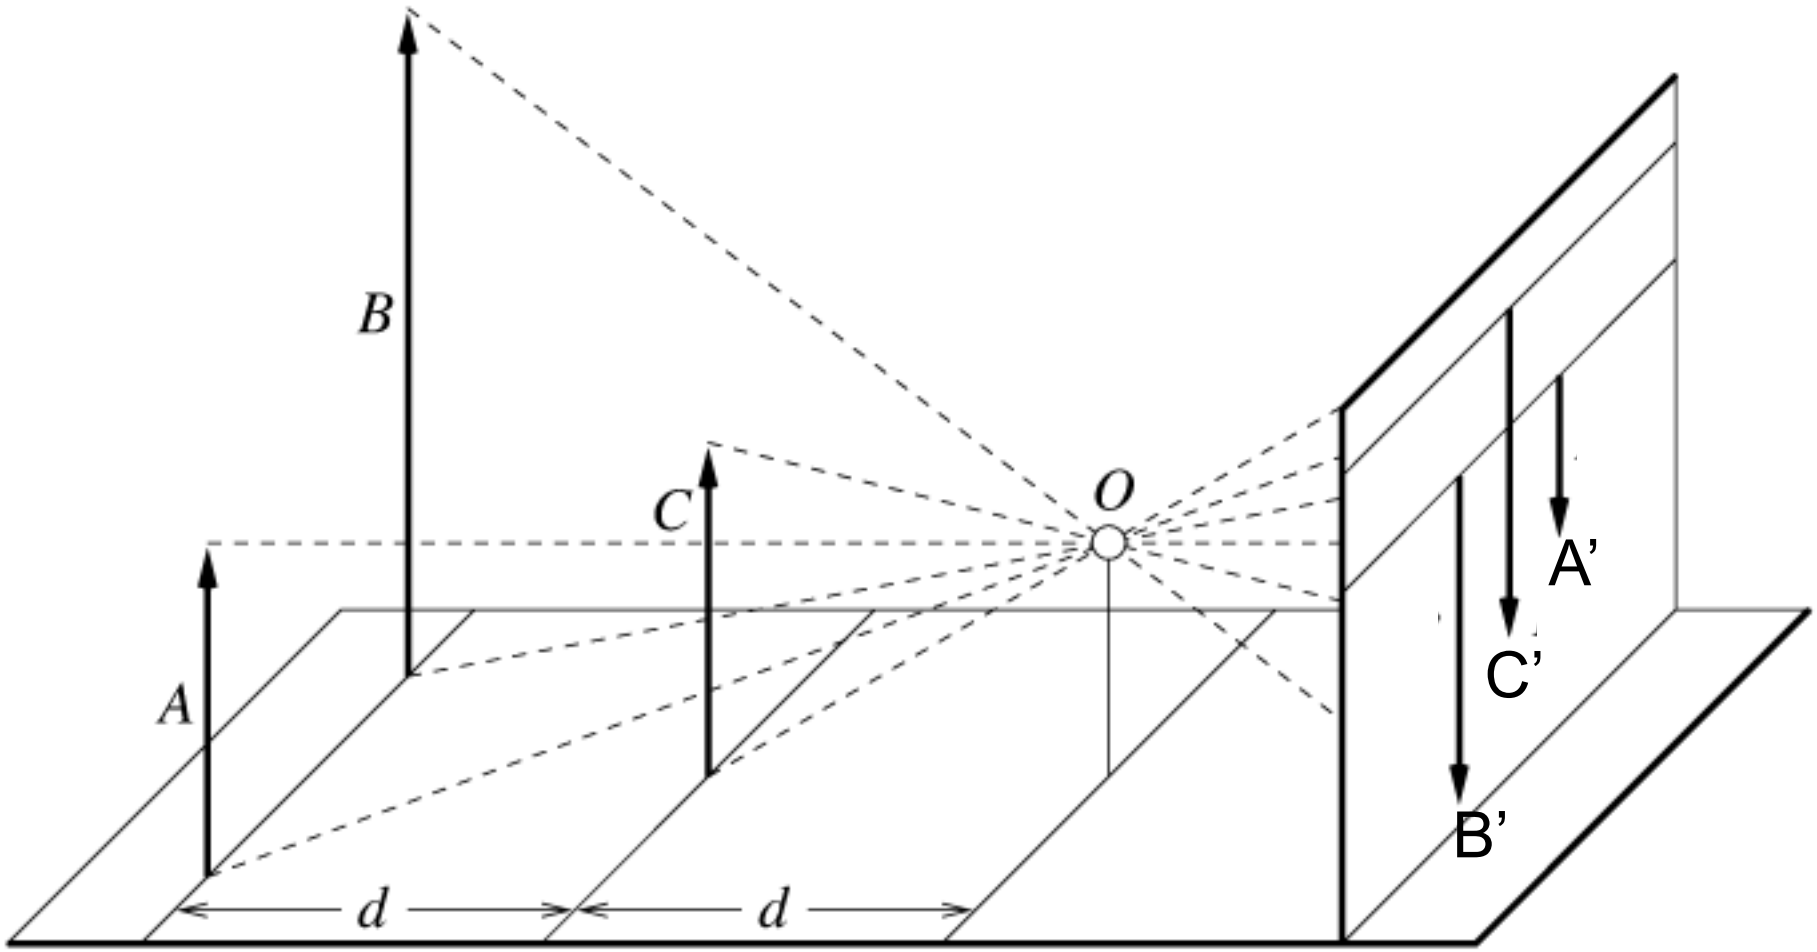

Figure by David Forsyth

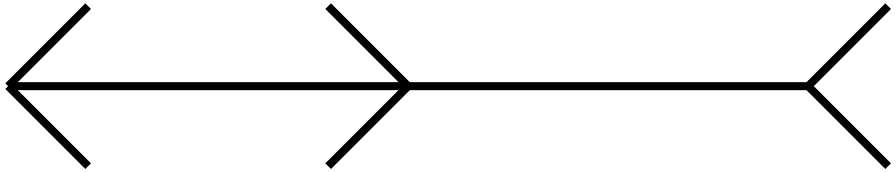
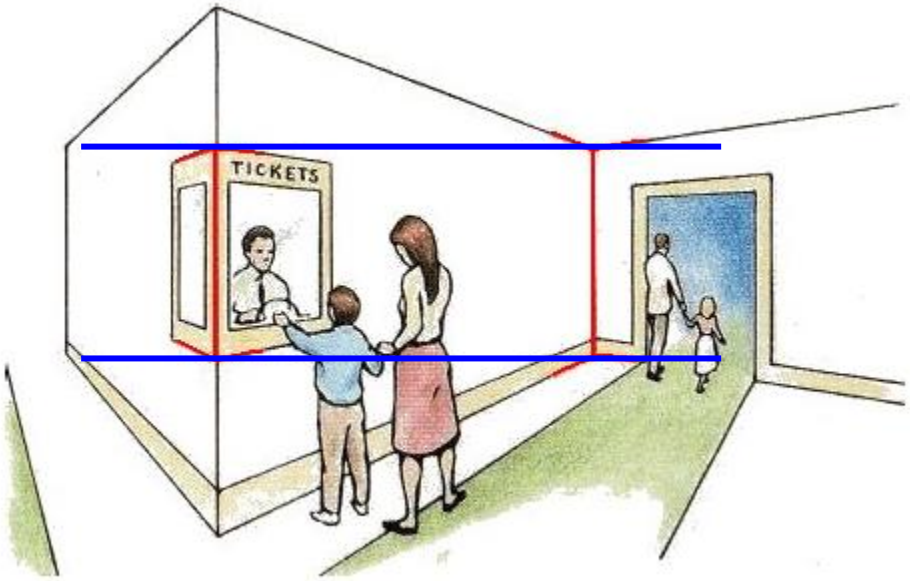
…but humans adopt!



Müller-Lyer Illusion



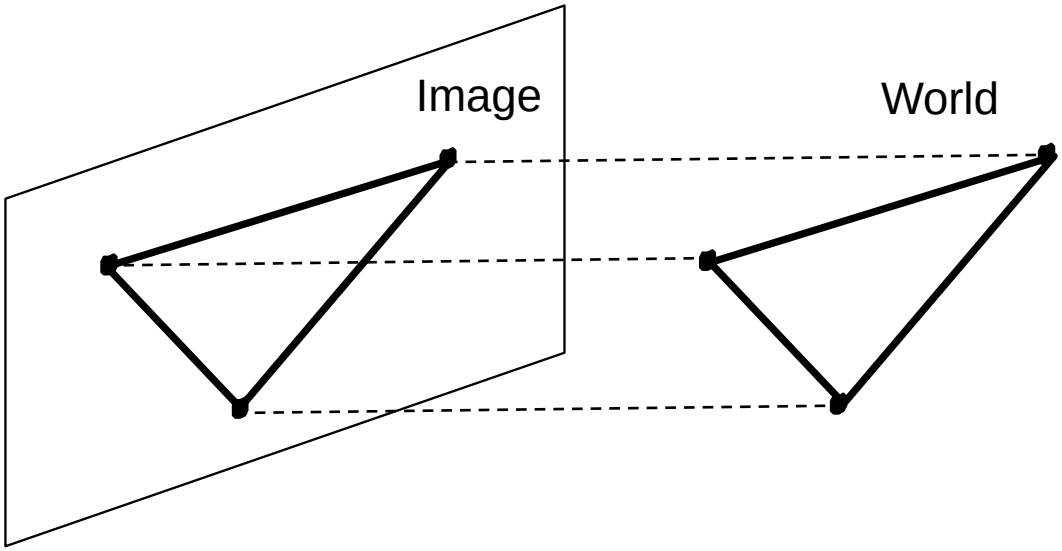
We don’t make measurements in the image plane

http://www.michaelbach.de/ot/sze_muelue/index.html

Other projections: Orthographic

Special case of perspective projection

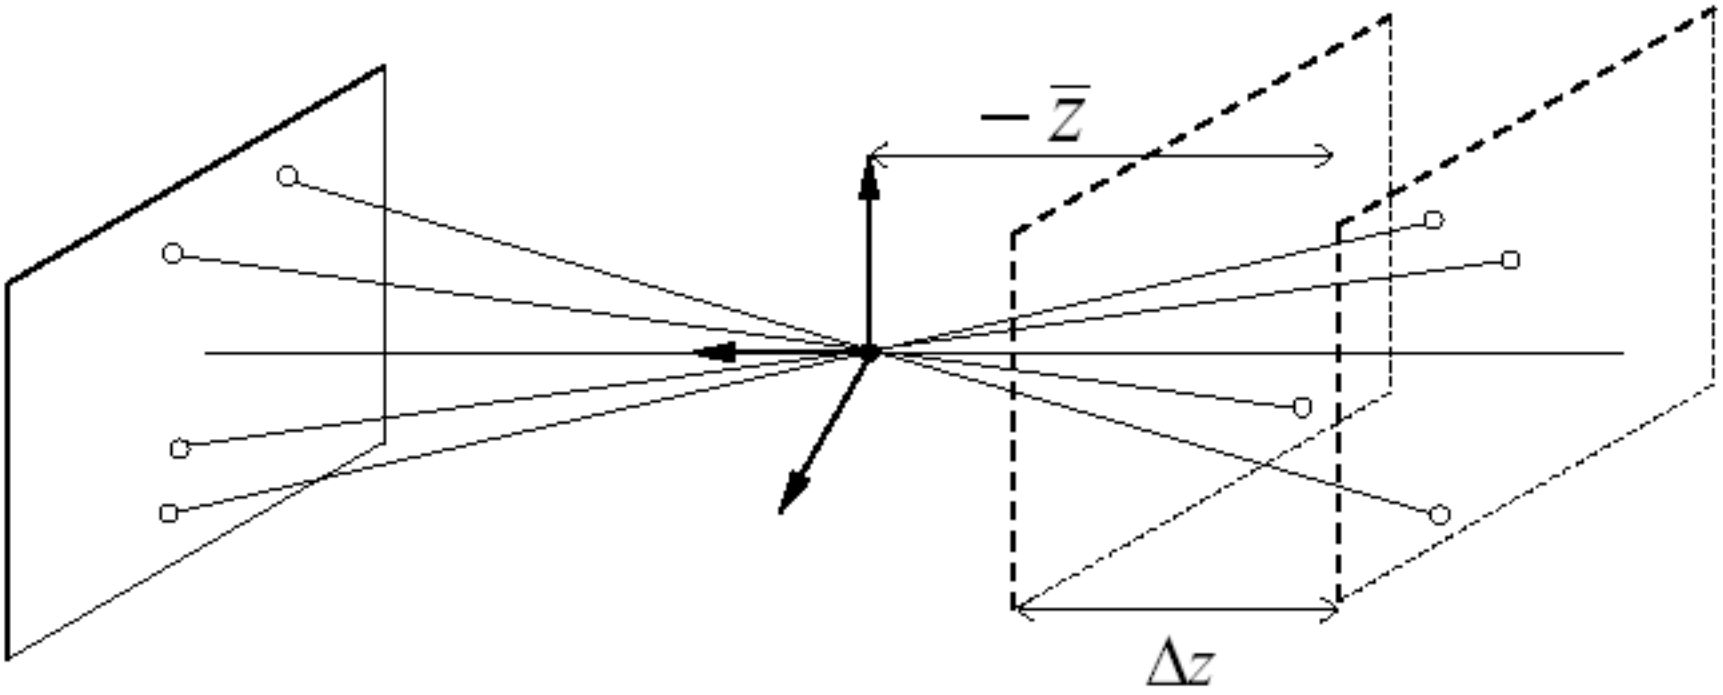
- Distance from the COP to the PP is infinite



- Also called “parallel projection”
- x’ = x
- y’ = y

Slide by Steve Seitz

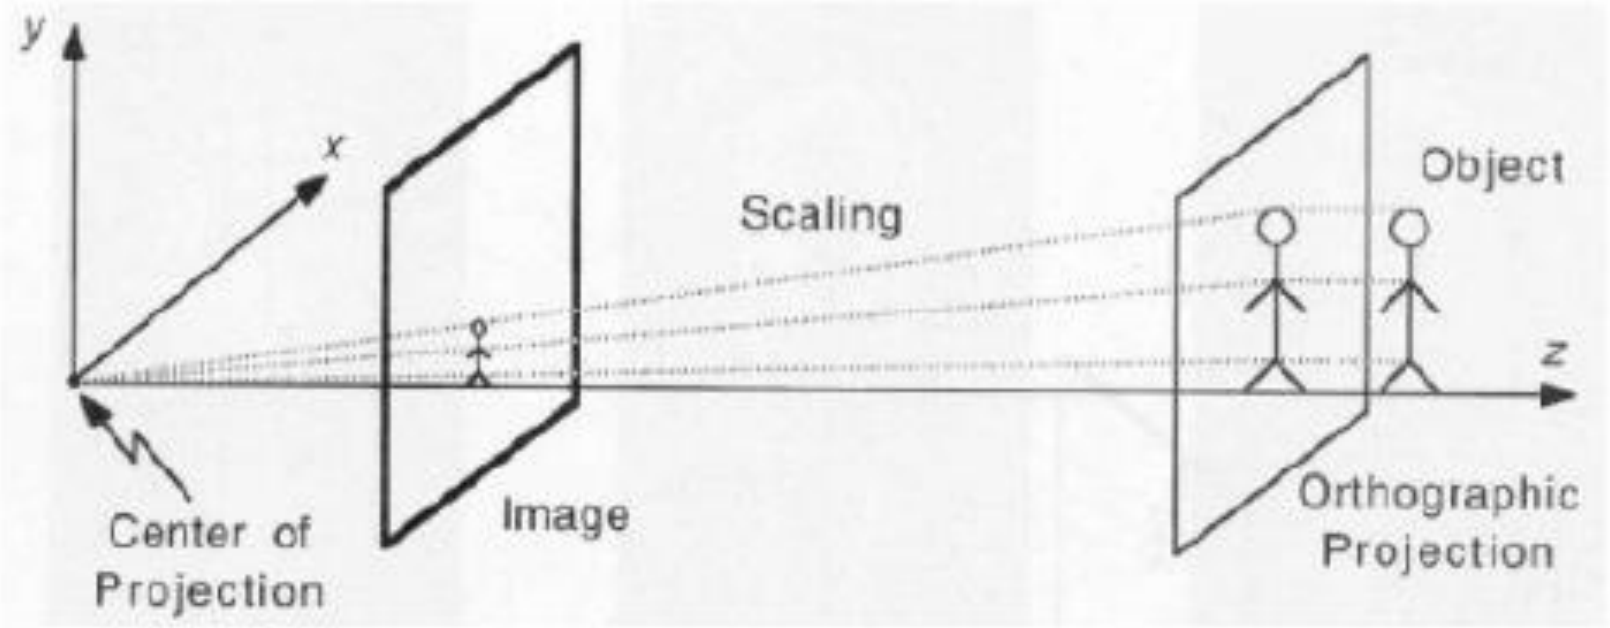
Scaled Orthographic or “Weak Perspective”



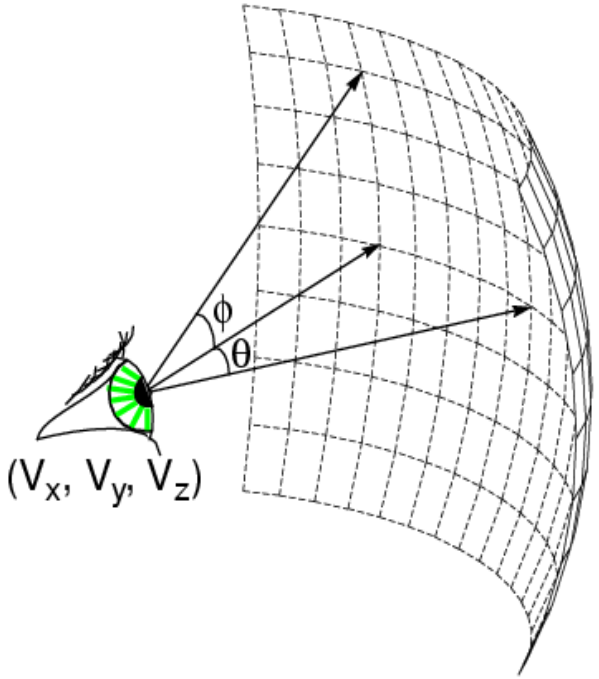
If $\Delta z << -\bar{z}$: $\quad x' \approx -mx \quad y' \approx -my \quad m = -\frac{f}{\bar{z}}$

Justified if scene depth is small relative to average distance from camera

Scaled Orthographic or “Weak Perspective”



Spherical Projection



What if PP is spherical with center at COP?

In spherical coordinates, projection is trivial:

$$(\theta,\phi) = (\theta,\phi,\mathrm{d})$$

Note: doesn't depend on focal length f!

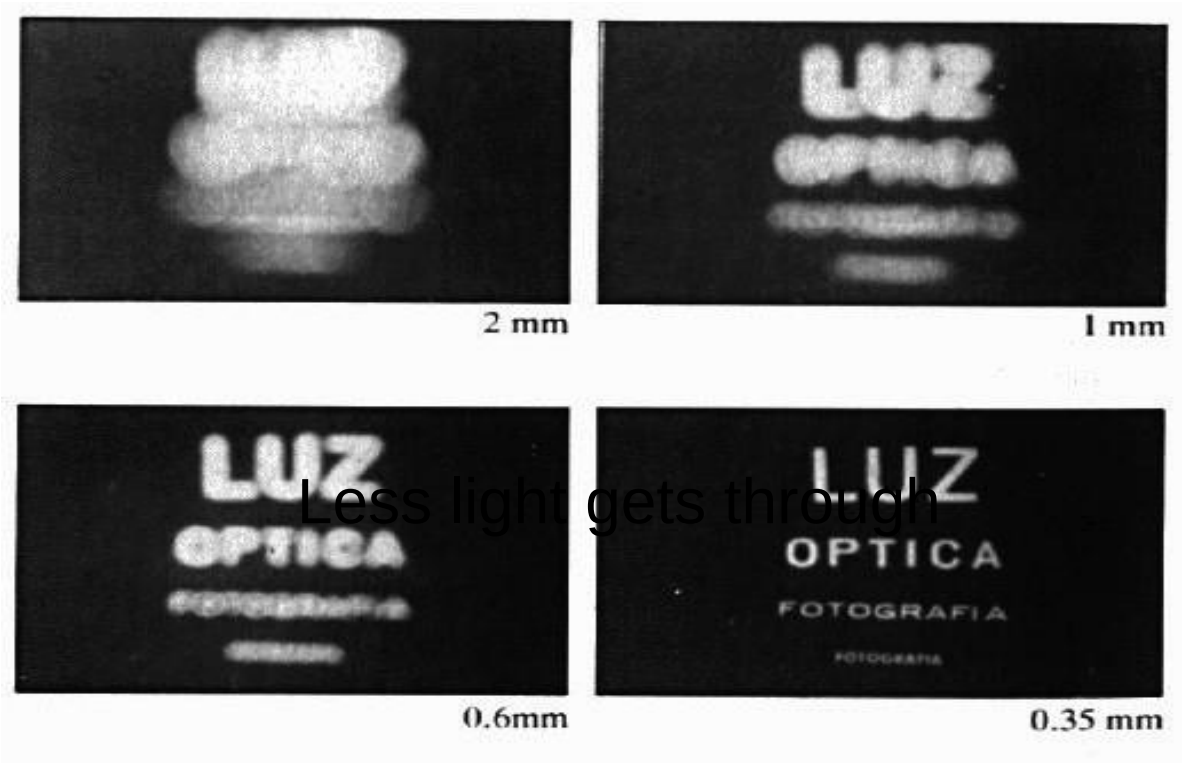
Building a real camera

Another way to make pinhole camera

Why so blurry?

http://www.debevec.org/Pinhole/

Shrinking the aperture



Less light gets through

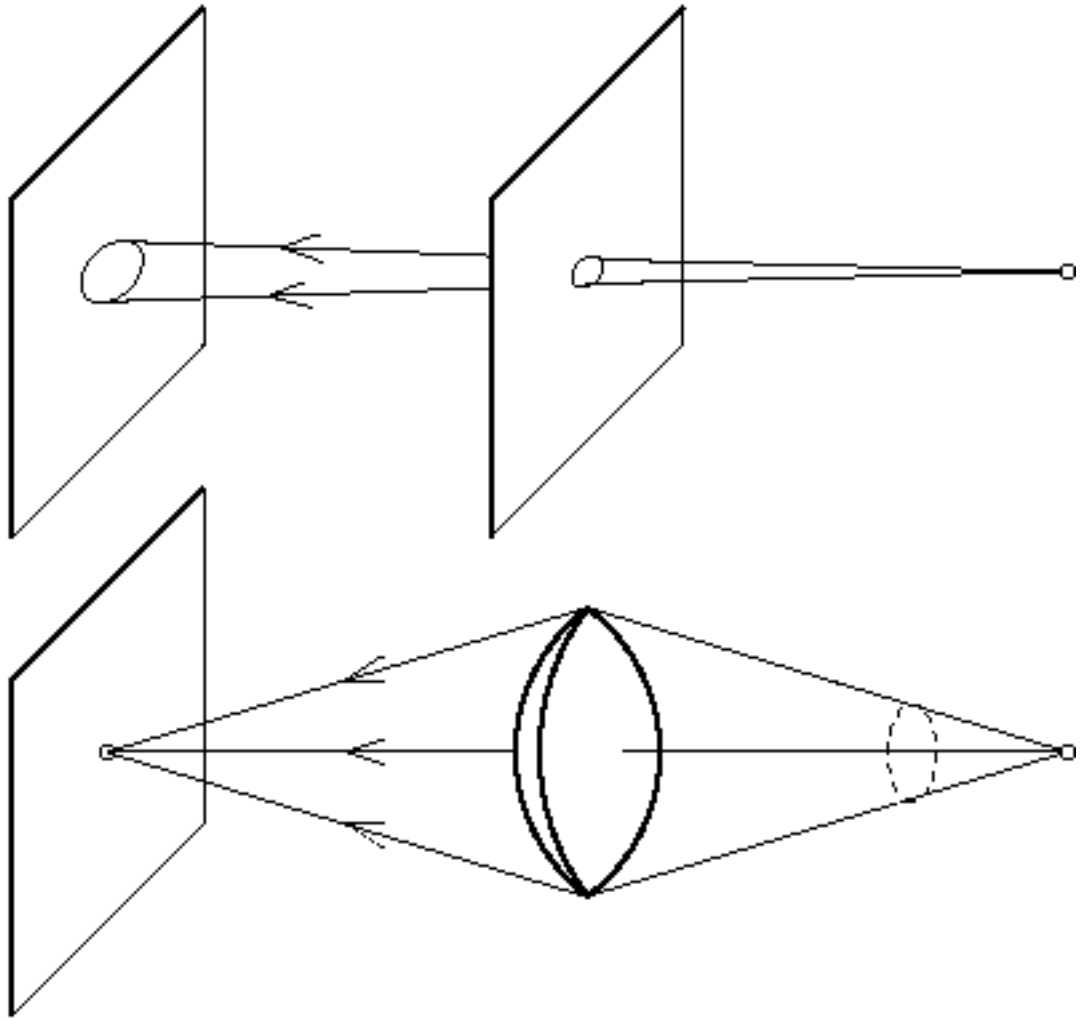
Why not make the aperture as small as possible?

- Less light gets through
- Diffraction effects…

Slide by Steve Seitz

Shrinking the aperture

The reason for lenses



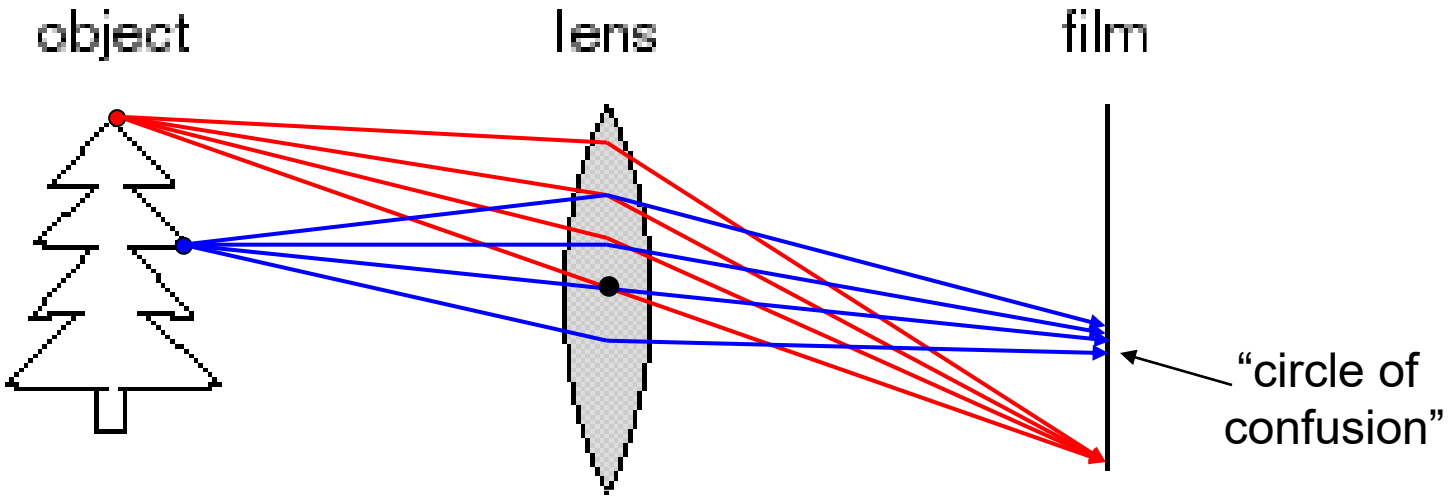
Slide by Steve Seitz

Replacing pinholes with lenses

Photography, London et al

Focus

Focus and Defocus

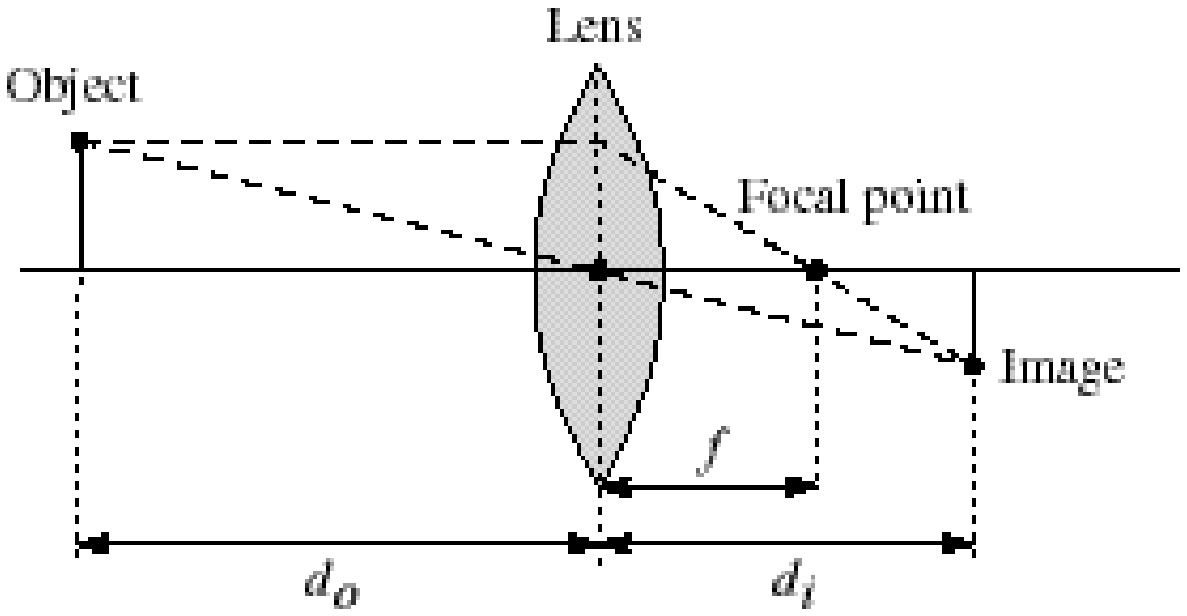


A lens focuses light onto the film

- There is a specific distance at which objects are “in focus”
  - other points project to a “circle of confusion” in the image
- Changing the shape of the lens changes this distance

Slide by Steve Seitz

Thin lenses



Thin lens equation: $\frac{1}{d_o} + \frac{1}{d_i} = \frac{1}{f}$

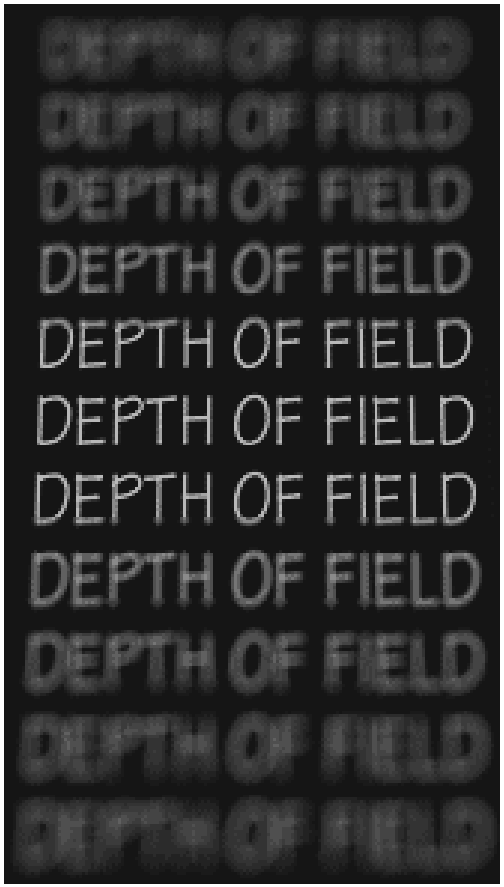
- Any object point satisfying this equation is in focus
- What is the shape of the focus region?
- Thin lens applet: http://www.phy.ntnu.edu.tw/java/Lens/lens_e.html (by Fu-Kwun Hwang)

Slide by Steve Seitz

Varying Focus

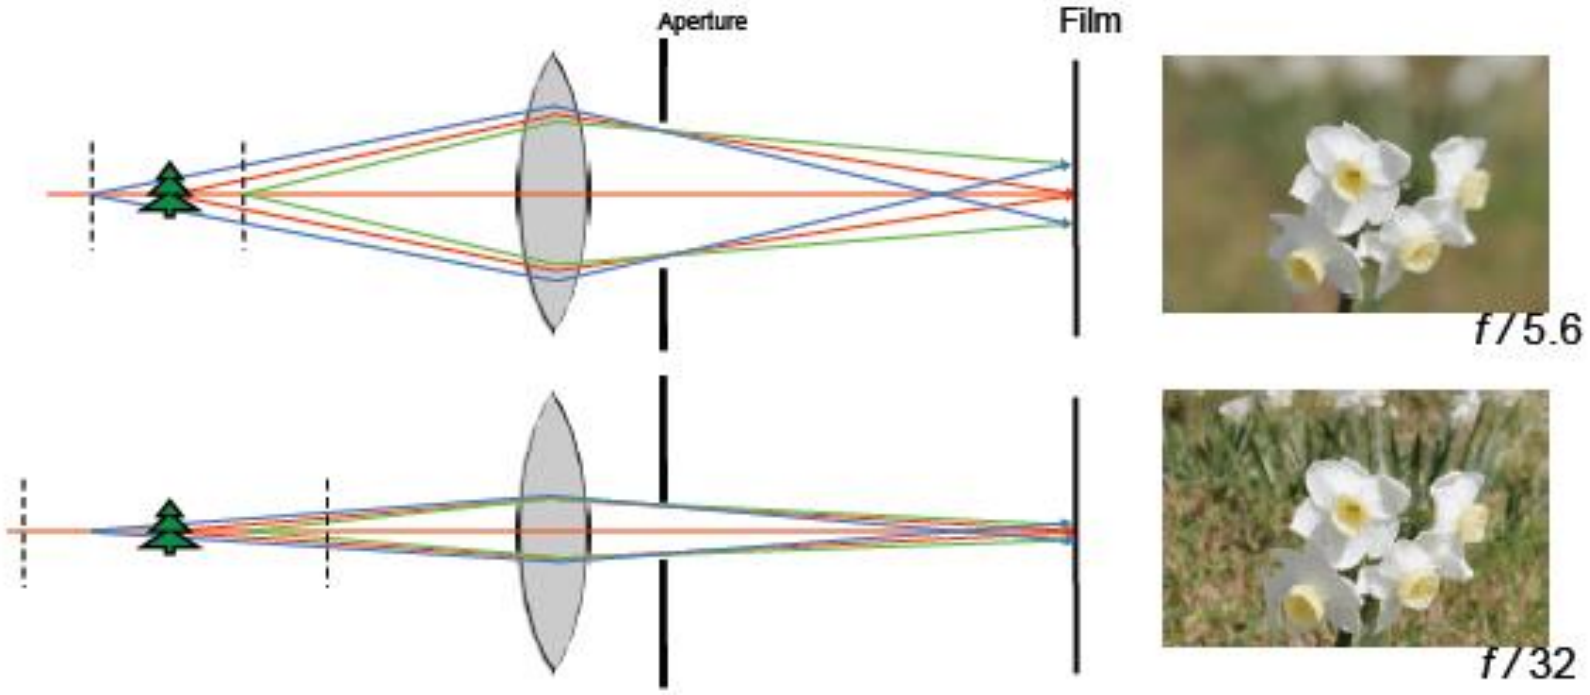
Depth Of Field

Depth of Field



http://www.cambridgeincolour.com/tutorials/depth-of-field.htm

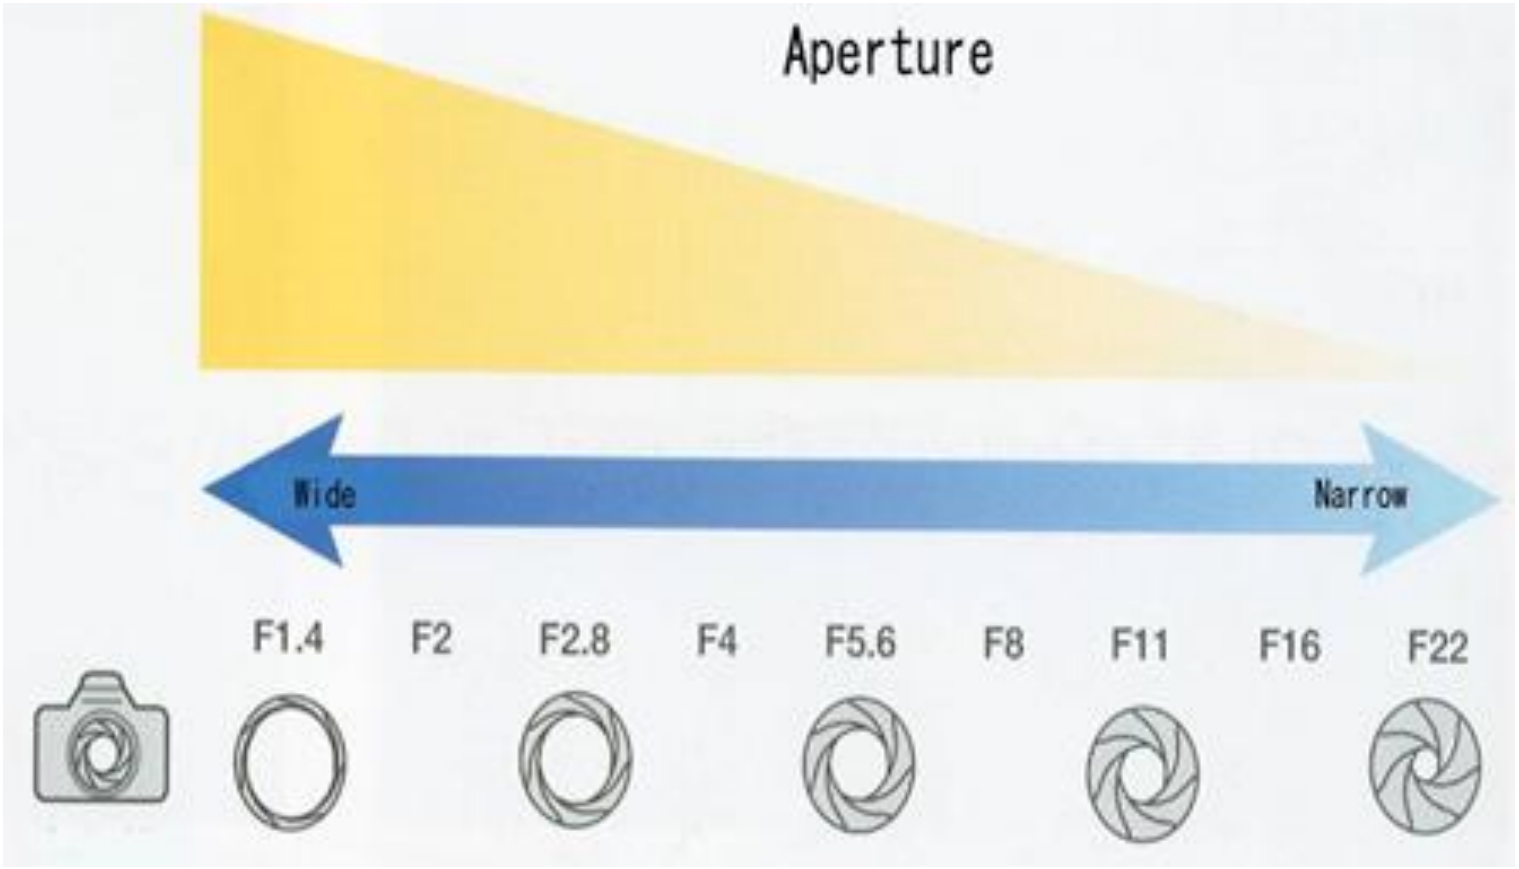
Aperture controls Depth of Field



Changing the aperture size affects depth of field

- A smaller aperture increases the range in which the object is approximately in focus
- But small aperture reduces amount of light – need to increase exposure

F-number: focal length / aperture diameter



Varying the aperture

Wide apeture = small DOF

Narrow apeture = large DOF

Nice Depth of Field effect

Field of View (Zoom)

Field of View (Zoom)

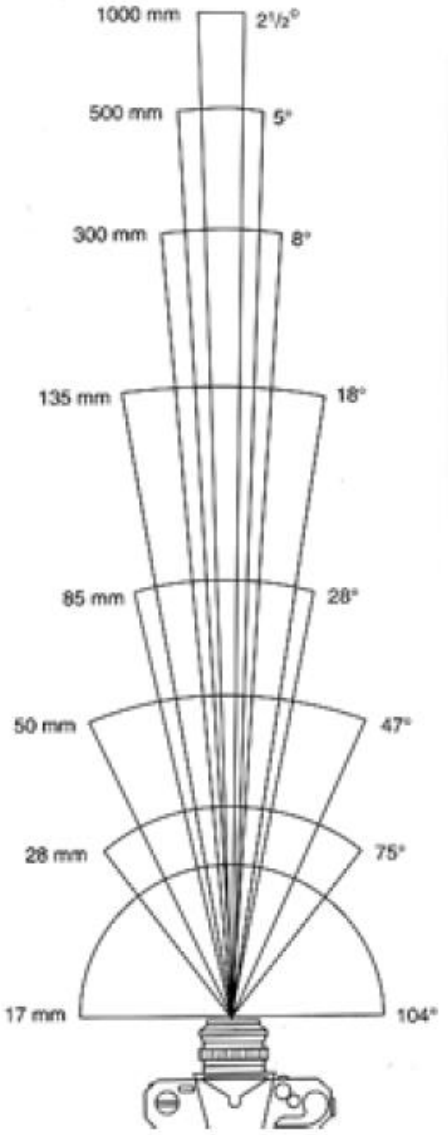
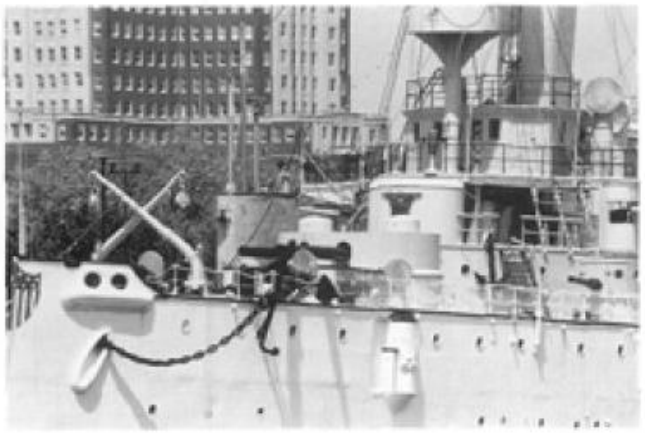
Field of View (Zoom) = Cropping



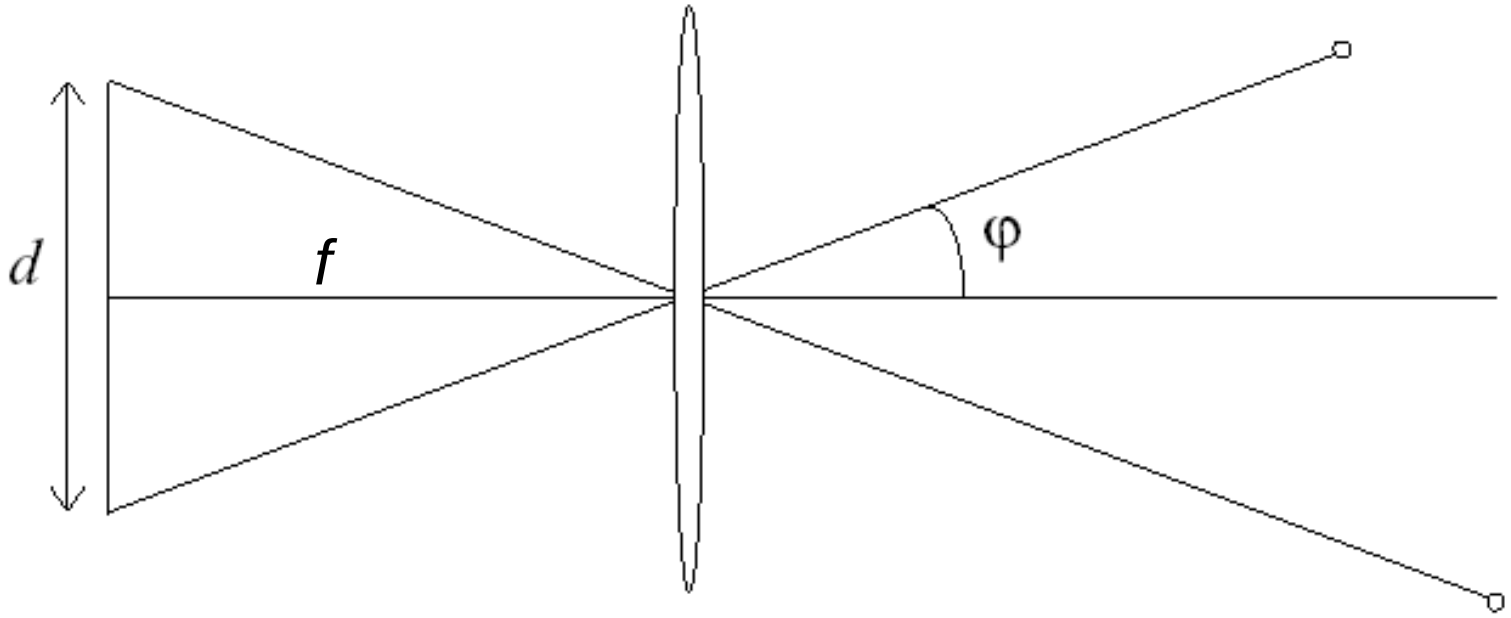
135mm



300mm

From London and Upton

FOV depends of Focal Length



Size of field of view governed by size of the camera retina:

$$\varphi = \tan^{-1}\left(\frac{d}{2f}\right)$$

Smaller FOV = larger Focal Length

Expensive toys…

Sigma 200-500mm F2.8 EX DG lens

What does 1600mm lens look like?

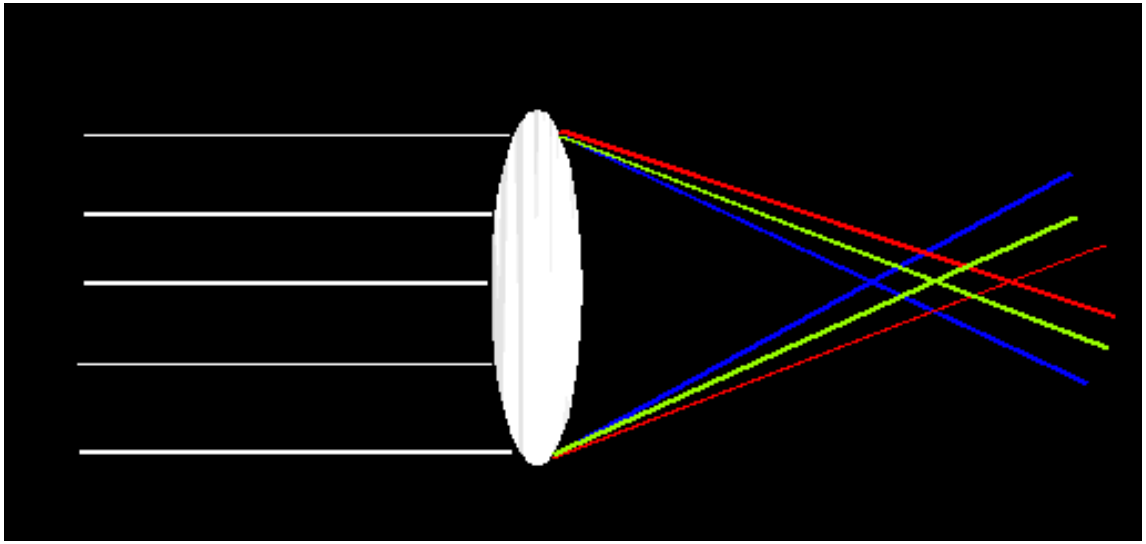
Lens Flaws

Lens Flaws: Chromatic Aberration

Dispersion: wavelength-dependent refractive index

- (enables prism to spread white light beam into rainbow)

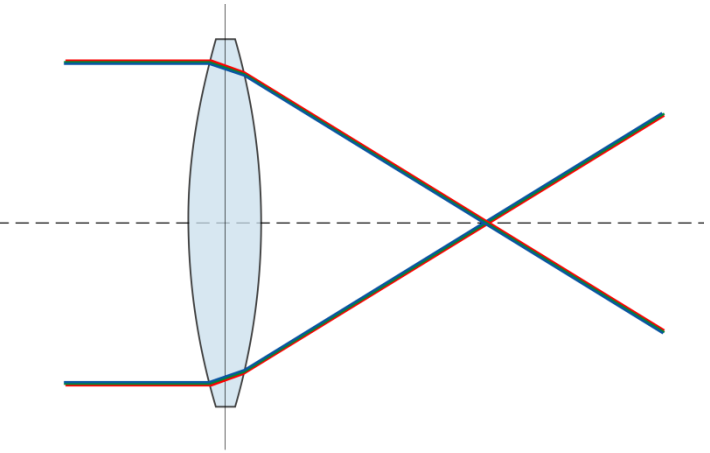
Modifies ray-bending and lens focal length: f(λ)

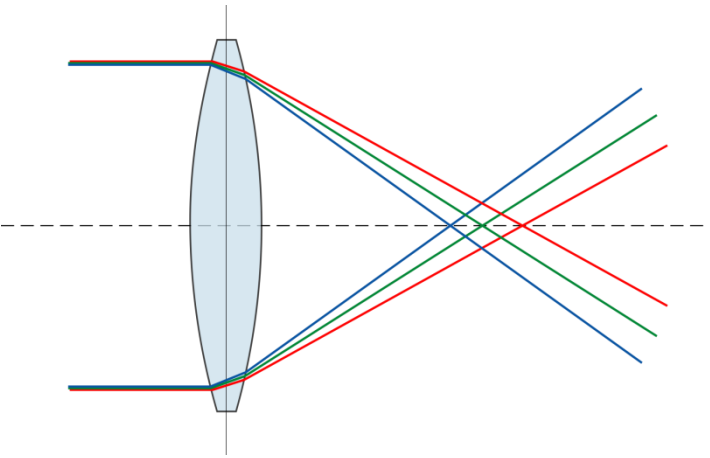


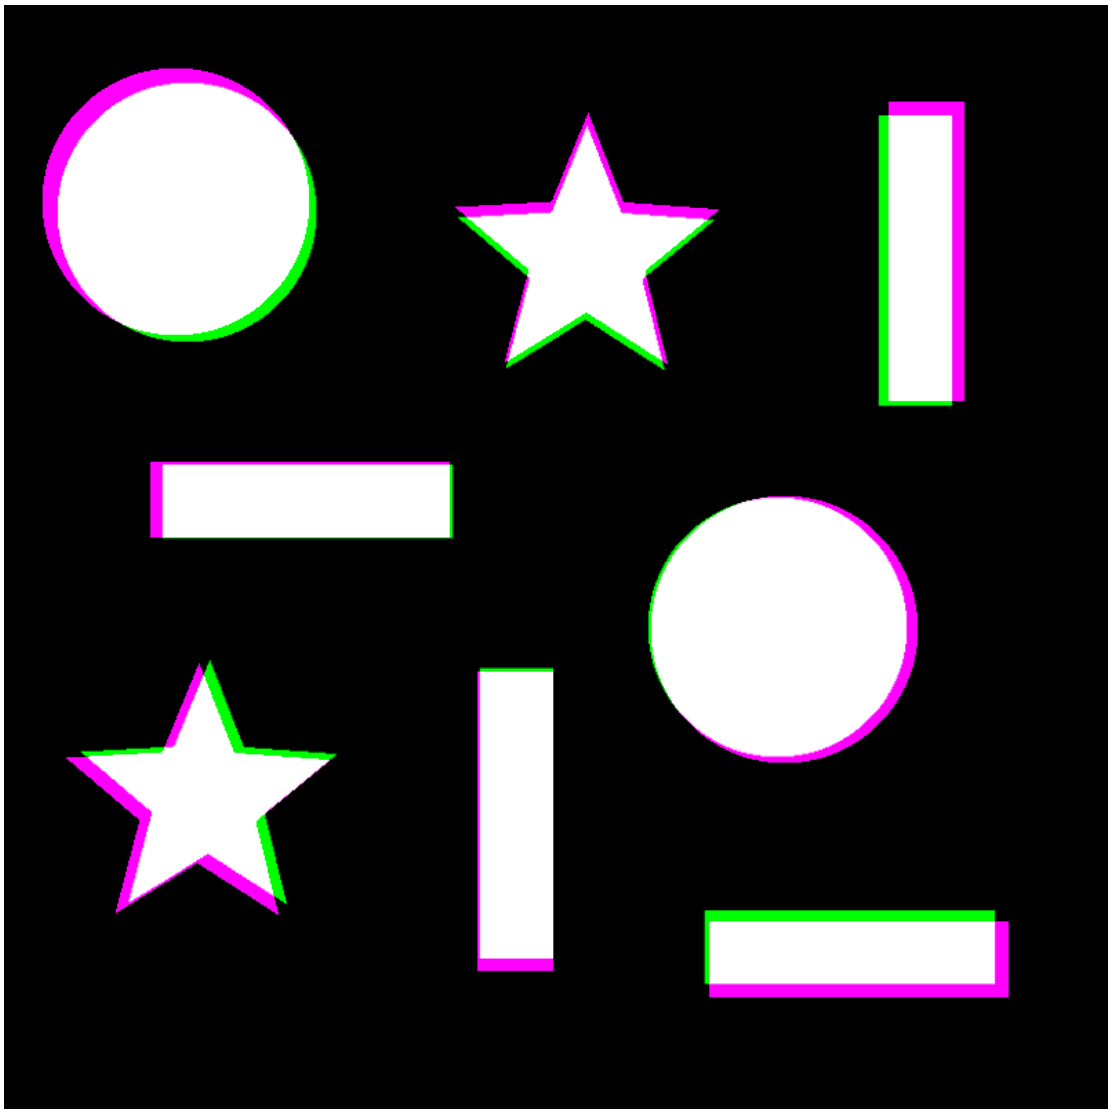
color fringes near edges of image

Corrections: add ‘doublet’ lens of flint glass, etc.

Chromatic Aberration







Slide by Carl Doersch

Chromatic Aberration

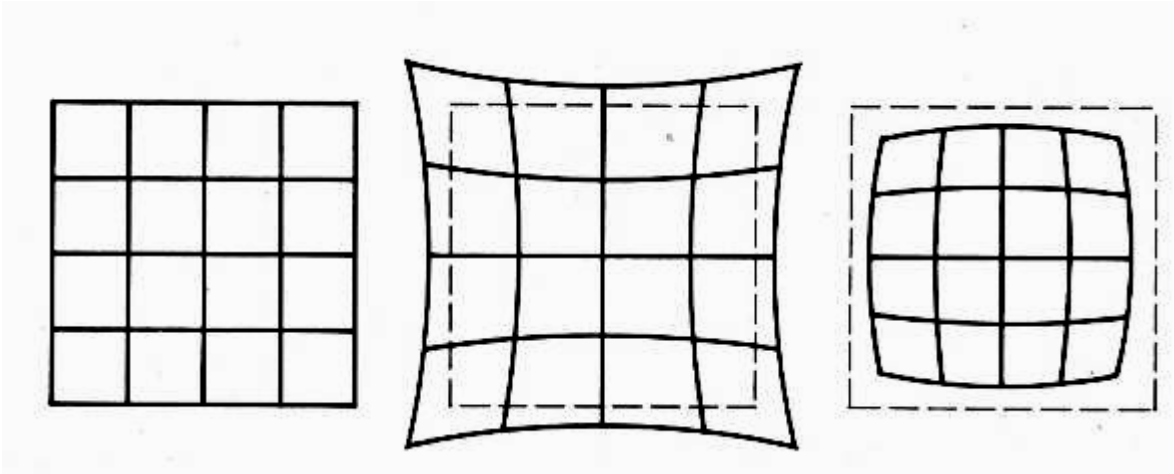
Near Lens Center

Near Lens Outer Edge

Radial Distortion (***e.g.*** ‘Barrel’ and ‘pin-cushion’)

straight lines curve around the image center

Radial Distortion



No distortion Pin cushion Barrel

Radial distortion of the image

- Caused by imperfect lenses
- Deviations are most noticeable for rays that pass through the edge of the lens

Radial Distortion
