Name of the person sitting to your right :	

You have 3 hours to finish this test, but there should only be about 2 hours worth of material. Your exam should contain 6 problems (numbered 0-5) and 1 appendix on 6 total pages.

This is an open-book test. You may consult any books, notes, or other paper-based inanimate objects available to you. Read the problems carefully. If you find it hard to understand a problem, ask us to explain it.

Restrict yourself to Scheme constructs covered in this course (i.e., in the lab materials, case studies, book chapters that were assigned, and lectures). Use descriptive names in all your code. Remember, use sentence operators only on sentences, not lists!

Please write your answers in the spaces provided in the test; if you need to use the back of a page make sure to clearly tell us so on the front of the page.

Partial credit will be awarded where we can, so do try to answer each question.

Good Luck!

(Pts))Problem	Your Score
(1)	Prob 0	
(3)	Prob 1a	
(2)	1b	
(2)	1c	
(5)	2	
(5)	3	
(5)	4

Page 2

Problem 0: Your name, please! (1 point)

Put your instructional login name (e.g., cs3-ab) on the top of each page.

Problem 1: Loop-de-Loop (Part A: 3 points, Part B: 2 points, Part C: 2 points)

Gilbert has opened up a side business while he is in school... He's running a new hip airline where every seat comes with a computer (rather than a TV). He has a bunch of flights lined but he needs to figure out if once he flies someone somewhere they can get home... He has an association list of all of his flights. There is only ever ONE flight out of an airport...

Someone has written a buggy version of can-get-home.

(continued on next page)

Part B: Describe the bug(s)

Part C: Describe how you might fix the bug(s)

Problem 2: (5 points)

Write a procedure airplane-routes that returns a list representing the path from a particular location. The last element in the list should be the original location, unless the original location can not be reached. If a loop occurs, it should contain each of the cities in the loop only once.

Problem 3: (5 points)

Write a procedure parenthesis-to-word-ratio that returns the total number of words in a list divided by the total number of parentheses in a list.

```
(parenthesis-to-word-ratio '(())) \rightarrow 0

(parenthesis-to-word-ratio '((a))) \rightarrow 1/4 or .25

(parenthesis-to-word-ratio '( a ( ( x ) a ) (b c d e f) ) \rightarrow 1
```

Problem 4: Bowling with Lists (5 points)

Write the procedure bowling-helper that takes a list of bowling roles and makes a list of lists representing the frames of the bowling game. (in the example below we'll assume that a bowling game consists of 5 frames instead of 10).
