Announcements
- Take-home quiz released Wednesday 9/10 at 3pm, due Thursday 9/11 at 11:59pm
  - 3 points; graded for correctness
- Submit in the same way that you submit homework assignments
- If you receive 0/3, you will need to talk to the course staff or be dropped
- Open computer & course materials, but no external resources such as classmates
- Practice quiz from Fall 2013: http://inst.eecs.berkeley.edu/~cs61a/fa13/hw/quiz1.html
- "Practical Programming Skills" DeCal starts Thursday 9/11, 6:30pm to 8pm in 306 Soda
  - http://42.cs61a.org, run by Sumukh Sridhara (TA)
- Guerrilla Section 1 on Higher-order functions: Saturday 9/13, 12:30pm to 3pm in 306 Soda
  - Homework 2 (which is small) due Monday 9/15 at 11:59pm.
  - Project 1 (which is BIG) due Wednesday 9/17 at 11:59pm.
- Office Hours: You Should Go!
  - You are not alone!
    - http://cs61a.org/staff.html
- Environments for Higher-Order Functions
- Environments Enable Higher-Order Functions
  - Functions are first-class: Functions can be manipulated as values in our programming language.
  - Higher-order function: A function that takes a function as an argument value or
    returns a function as a return value
  - Higher-order functions:
    - Express general methods of computation
    - Remove repetition from programs
    - Separate concerns among functions
  - Environment diagrams describe how higher-order functions work!
    - (Demo)
- Names can be Bound to Functional Arguments
- Discussion Question
  - What is the value of the final expression below? (Demo)
    - def repeat(f, x):
      while f(x) != x:
        x = f(x)
      return x
    - def g(y):
      return (y + 5) // 3
    - result = repeat(g, 5)
- Environments for Nested Definitions
  - Interactive Diagram
Every user-defined function has a parent frame (often global).

The parent of a function is the frame in which it was defined.

Every local frame has a parent frame (often global).

The parent of a frame is the parent of the function called.

How to Draw an Environment Diagram

When a function is defined:

Create a function value: `func <name>(<formal parameters>) [parent=<label>]`

Its parent is the current frame.

$\text{f1}: \text{make_adder} \quad \text{func adder(k) [parent=f1]}

Bind `<name>` to the function value in the current frame.

When a function is called:

1. Add a local frame, titled with the `<name>` of the function being called.
2. Copy the parent of the function to the local frame: `[parent=<label>]`
3. Bind the `<formal parameters>` to the arguments in the local frame.
4. Execute the body of the function in the environment that starts with the local frame.

Local Names

Local Names are not Visible to Other (Non-Nested) Functions

- An environment is a sequence of frames.
- The environment created by calling a top-level function (no `def` within `def`) consists of one local frame, followed by the global frame.

Function Composition

The Environment Diagram for Function Composition
