

61A Lecture 6

Monday, February 2

Announcements

- Homework 2 due Monday 2/2 @ 11:59pm
- Project 1 due Thursday 2/5 @ 11:59pm
 - Project party on Tuesday 2/3 5pm-6:30pm in 2050 VLSB
 - Partner party on Wednesday 2/4 3pm-4pm in Wozniak Lounge, Soda Hall
 - Earn 1 bonus point if you finish by Wednesday 2/4 @ 11:59pm
- Composition: Programs should be concise, well-named, understandable, and easy to follow
- Extra lecture 2 on Thursday 2/5 5pm-6:30pm in 2050 VLSB
 - Hog strategies & church numerals
- Midterm 1 on Monday 2/9 7pm-9pm
 - Conflict? Fill out the conflict form today! <http://goo.gl/2P5fKq>

Recursive Functions

Recursive Functions

Definition: A function is called recursive if the body of that function calls itself, either directly or indirectly.

Implication: Executing the body of a recursive function may require applying that function.

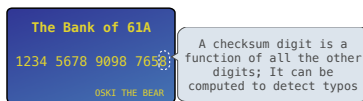

Drawing Hands, by M. C. Escher (Lithograph, 1948)

Digit Sums

$$2+0+1+5 = 8$$

- If a number a is divisible by 9, then $\text{sum_digits}(a)$ is also divisible by 9.
- Useful for typo detection!

- Credit cards actually use the Luhn algorithm, which we'll implement after `digit_sum`.

Sum Digits Without a While Statement

```
def split(n):
    """Split positive n into all but its last digit and its last digit."""
    return n // 10, n % 10

def sum_digits(n):
    """Return the sum of the digits of positive integer n."""
    if n < 10:
        return n
    else:
        all_but_last, last = split(n)
        return sum_digits(all_but_last) + last
```

The Anatomy of a Recursive Function

- The `def` statement header is similar to other functions
- Conditional statements check for **base cases**
- Base cases are evaluated **without recursive calls**
- Recursive cases are evaluated **with recursive calls**

```
def sum_digits(n):
    """Return the sum of the digits of positive integer n."""
    if n < 10:
        return n
    else:
        all_but_last, last = split(n)
        return sum_digits(all_but_last) + last
```

(Demo)

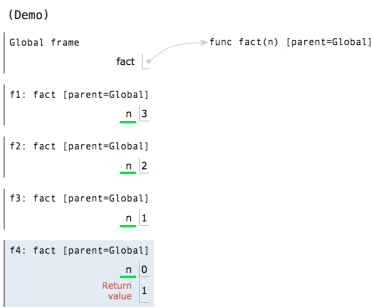

Recursion in Environment Diagrams

Recursion in Environment Diagrams

```

1 def fact(n):
2   if n == 0:
3     return 1
4   else:
5     return n * fact(n-1)
6
7 fact(3)

```

- The same function fact is called multiple times.
- Different frames keep track of the different arguments in each call.
- What n evaluates to depends upon which is the current environment.
- Each call to fact solves a simpler problem than the last: smaller n.

Interactive Diagram

Iteration vs Recursion

Iteration is a special case of recursion

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Using while:

```

def fact_iter(n):
  total, k = 1, 1
  while k <= n:
    total, k = total*k, k+1
  return total

```

Using recursion:

```

def fact(n):
  if n == 0:
    return 1
  else:
    return n * fact(n-1)

```

Math: $n! = \prod_{k=1}^n k$

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ n \cdot (n-1)! & \text{otherwise} \end{cases}$$

Names: n, total, k, fact_iter

n, fact

Verifying Recursive Functions

The Recursive Leap of Faith

```

def fact(n):
  if n == 0:
    return 1
  else:
    return n * fact(n-1)

```

Is fact implemented correctly?

1. Verify the base case.
2. Treat fact as a functional abstraction!
3. Assume that fact(n-1) is correct.
4. Verify that fact(n) is correct, assuming that fact(n-1) correct.

Photo by Kevin Lee, Preikestølen, Norway

Verifying Digit Sum

The sum_digits function computes the sum of positive n correctly because:

The sum of the digits of [redacted] (base case)

Assuming [redacted] (abstraction)

for all [redacted], (simpler case)

sum_digits(n) will be [redacted]. (conclusion)

```

def sum_digits(n):
  """Return the sum of the digits of positive integer n."""
  if n < 10:
    return n
  else:
    all_but_last, last = split(n)
    return sum_digits(all_but_last) + last

```

Mutual Recursion

The Luhn Algorithm

Used to verify credit card numbers

From Wikipedia: http://en.wikipedia.org/wiki/Luhn_algorithm

- From the rightmost digit, which is the check digit, moving left, double the value of every second digit; if product of this doubling operation is greater than 9 (e.g., $7 * 2 = 14$), then sum the digits of the products (e.g., 10: $1 + 0 = 1$, 14: $1 + 4 = 5$).

- Take the sum of all the digits.

1	3	8	7	4	3
2	3	1+6=7	7	8	3

= 30

The Luhn sum of a valid credit card number is a multiple of 10.

(Demo)

Recursion and Iteration

Converting Recursion to Iteration

Can be tricky: Iteration is a special case of recursion.

Idea: Figure out what state must be maintained by the iterative function.

```
def sum_digits(n):  
    """Return the sum of the digits of positive integer n."""  
    if n < 10:  
        return n  
    else:  
        all_but_last, last = split(n)  
        return sum_digits(all_but_last) + last
```

What's left to sum

A partial sum

(Demo)

Converting Iteration to Recursion

More formulaic: Iteration is a special case of recursion.

Idea: The state of an iteration can be passed as arguments.

```
def sum_digits_iter(n):  
    digit_sum = 0  
    while n > 0:  
        n, last = split(n)  
        digit_sum = digit_sum + last  
    return digit_sum  
  
def sum_digits_rec(n, digit_sum):  
    if n == 0:  
        return digit_sum  
    else:  
        n, last = split(n)  
        return sum_digits_rec(n, digit_sum + last)
```

Updates via assignment become...

...arguments to a recursive call
