CS61B Lecture #3

- **Reading**: Please read Chapter 4 of the reader *A Java Reference* for Friday (on Values, Types, and Containers).
- **Labs:** We are forgiving during the first week, but try to get your lab1 submitted properly by Friday night. *DBC: Let us know if you can't get something to work!*
- **Homework:** Please see Homework #1 on the lab page.

More Iteration: Sort an Array

Problem.　Print out the command-line arguments in order:

```
% java sort the quick brown fox jumped over the lazy dog
brown dog fox jumped lazy over quick the the
```

Plan.

```
class Sort {
  /** Sort and print WORDS lexicographically. */
  public static void main (String[] words) {
    sort (words, 0, words.length-1);
    print (words);
  }

  /** Sort items A[L..U], with all others unchanged. */
  static void sort (String[] A, int L, int U) { /* TOMORROW */ }

  /** Print A on one line, separated by blanks. */
  static void print (String[] A) { /* TOMORROW */ }
}
```

Selection Sort

```
/** Sort items A[L..U], with all others unchanged. */
static void sort (String[] A, int L, int U) {
  if (L < U) {
    int k = indexOfLargest (A, L, U);
    String tmp = A[k];  A[k] = A[U]; A[U] = tmp;
    sort (A, L, U-1);       // Sort items L to U-1 of A
  }
}
```

Iterative version:

```
  while (L < U) {
    int k = indexOfLargest (A, L, U);
    String tmp = A[k];  A[k] = A[U]; A[U] = tmp;
    U -= 1;
  }
```

And we're done! Well, OK, not quite.

Really Find Largest

```
/** Value k, I0<=k<=I1, such that V[k] is largest element among
 *  V[I0], ... V[I1]. Requires I0<=I1. */
static int indexOfLargest (String[] V, int i0, int i1) {
  if (i0 >= i1)
    return i1;
  else /* if (i0 < i1) */ {
    int k = indexOfLargest (V, i0+1, i1);
    return (V[i0].compareTo (V[k]) > 0) ?  i0 :  k;
    // or  if (V[i0].compareTo (V[k]) > 0) return i0; else return k;
  }
}
```

Iterative:

```
  int i, k;
  k = i1;     // Deepest iteration
  for (i = i1-1; i >= i0; i -= 1)
    k = (V[i].compareTo (V[k]) > 0) ?  i :  k;
  return k;
```

Finally, Printing

```
/** Print A on one line, separated by blanks. */
static void print (String[] A) {
  for (int i = 0; i < A.length; i += 1)
    System.out.print (A[i] + " ");
  System.out.println ();
}

/* Looking ahead: There's a brand-new syntax for the for
 * loop here (as of J2SE 5): */
  for (String s : A)
    System.out.print (s + " ");
/* Use it if you like, but let's not stress over it yet! */
```

Another Problem

Given an array of integers, A, move its last element, A[A.length−1], to just after nearest previous item that is ≤ to it (shoving other elements to the right). For example, if A starts out as

    { 1, 9, 4, 3, 0, 12, 11, 9, 15, 22, 12 }

then it ends up as

    { 1, 9, 4, 3, 0, 12, 11, 9, 12, 15, 22 }

If there is no such previous item, move A[A.length−1] to the beginning of A (i.e., to A[0]). So

    { 1, 9, 4, 3, 0, 12, 11, 9, 15, 22, −2 }

would become

    { −2, 1, 9, 4, 3, 0, 12, 11, 9, 15, 22 }

  (Preliminary question: How can I state this without making this last case special?)

A Solution (from class)

```
class Shove {
    /** Move A[A.length-1] so that all items after it are greater than
     *  it is, displacing those items to the right (towards
     *  higher indices). */
    static void moveOver(int[] A) {
        for (int i = A.length - 2; i >= 0; i -= 1) {
            if (A[i] <= A[i+1])
                break;
            int tmp = A[i]; A[i] = A[i+1]; A[i+1] = tmp;
        }
    }
}
```
