CS61c Summer 2015 Discussion 3 – MIPSII/Instruction Formats

1 Translating between C and MIPS

Translate between the C and MIPS code. You may want to use the MIPS Green Sheet as a reference. In all of the C examples, we show you how the different variables map to registers – you don't have to worry about the stack or any memory-related issues.

C	MIPS

`// Strcpy:`
`// $s1 -> char s1[]`
`// $s2 -> char *s2 =`
`//  malloc(sizeof(char)*7);`
`int i = 0;`
`do {`
`  s2[i] = s1[i];`
`  i++;`
`} while(s1[i] != '\0');`
`s2[i] = '\0';`
	`  addiu $t0, $0, 0`
	`Loop: addu $t1, $s1, $t0  # s1[i]`
	`  addu $t2, $s2, $t0  # s2[i]`
	`  lb  $t3, 0($t1)  # char is`
	`  sb  $t3, 0($t2)  # 1 byte!`
	`  addiu $t0, $t0, 1`
	`  addiu $t1, $t1, 1`
	`  ----------`
	`  ----------`
	`Done: sb  $t4, 1($t2)`

`// Nth_Fibonacci(n):`
`// $s0 -> n, $s1 -> fib`
`// $t0 -> i, $t1 -> j`
`// Assume fib, i, j are initialized:`
`// fib = 1, i = 1, j = 1;`
`if (n==0)  return 0;`
`else if (n==1) return 1;`
`n -= 2;`
`while (n != 0) {`
`  fib = i + j;`
`  j = i;`
`  i = fib;`
`  n--;`
`}`
`return fib;`
	`  ...`
	`  ----------`
	`  ----------`
	`  ----------`
	`  addiu $s0, $s0, -2`
	`Loop: ----------`
	`  addu $s1, $t0, $t1`
	`  addiu $t0, $t1, 0`
	`  addiu $t1, $s1, 0`
	`  addiu $s0, $s0, -1`
	`  ----------`
	`Ret0: addiu $v0, $0, 0`
	`  j  Done`
	`Ret1: addiu $v0, $0, 1`
	`  j  Done`
	`RetF: addu $v0, $0, $s1`
	`Done: ...`

`// Collatz conjecture`
`// $s0 -> n`
`unsigned n;`
`L1: if (n % 2) goto L2;`
`goto L3;`
`L2: if (n == 1) goto L4;`
`n = 3 * n + 1;`
`goto L1;`
`L3: n = n >> 1;`
`goto L1;`
`L4: return n;`
	`L1:  addiu $t0, $0, 2`
	`  div $s0, $t0  # puts (n%2) in $hi`
	`  mfhi $t0  # sets $t0 = (n%2)`
	`  ----------`
	`  j L3`
	`L2:  addiu $t0, $0, 1`
	`  ----------`
	`  addiu $t0, $0, 3`
	`  mul $s0, $s0, $t0`
	`  addiu $s0, $s0, 1`
	`  ----------`
	`L3:  srl $s0, $s0, 1`
	`  ----------`
	`L4:  ...`

2 MIPS Addressing Modes

- We have several **addressing modes** to access memory (immediate not listed):
  (a) **Base displacement addressing:** Adds an immediate to a register value to create a memory address (used for lw, lb, sw, sb)
  (b) **PC-relative addressing:** Uses the PC (actually the current PC plus four) and adds the I-value of the instruction (multiplied by 4) to create an address (used by I-format branching instructions like beq, bne)
  (c) **Pseudodirect addressing:** Uses the upper four bits of the PC and concatenates a 26-bit value from the instruction (with implicit 00 lowest bits) to make a 32-bit address (used by J-formatinstructions)
  (d) **Register Addressing:** Uses the value in a register as a memory address (jr)

(1) You need to jump to an instruction that 2^{28} + 4 bytes higher than the current PC. How do you do it? Assume you know the exact destination address at compile time. (Hint: you need multiple instructions)

(2) You now need to branch to an instruction 2^{17} + 4 bytes higher than the current PC, when $t0 equals 0. Assume that were not jumping to a new 2^{28} byte block. Write MIPS to do this.

(3) Given the following MIPS code (and instruction addresses), fill in the blank fields for the following instructions (youll need your green sheet!):

```
0x002cff00: loop: addu $t0, $t0, $t0      | 0 |   |   |   |   |      |
0x002cff04:       jal  foo                | 3 |                      |
0x002cff08:       bne  $t0, $zero, loop   | 5 | 8 |   |              |
...
0x00300004: foo:  jr $ra                  $ra=_____________
```

(4) What instruction is 0x00008A03?
