CS61C : Machine Structures

Get your clickers ready...

Lecture 3 – Introduction to the C Programming Language (pt 1)

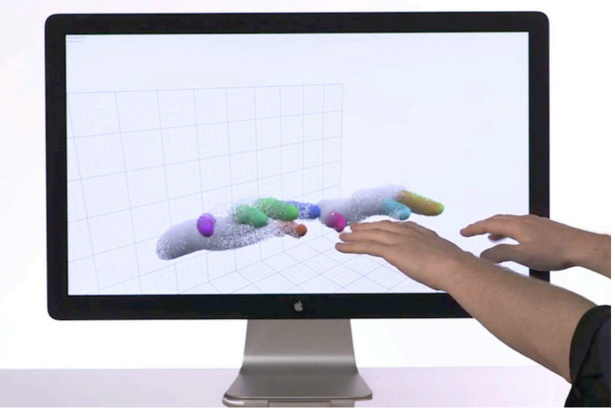
2013-01-28

Hello to Nishant Varma watching from India!

Senior Lecturer SOE Dan Garcia

www.cs.berkeley.edu/~ddgarcia

Leap Motion ⇒



The Leap Motion ($70) is a new generation of input devices that stands to change the way people interact with 3D data, and provide input to the computer (significant advantages over mouse & tablet)

www.leapmotion.com

You can all (in theory) be in the class!!

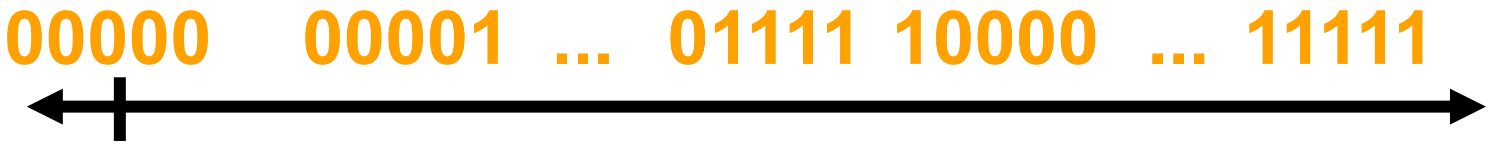
And in review...

META: We often make design decisions to make HW simple

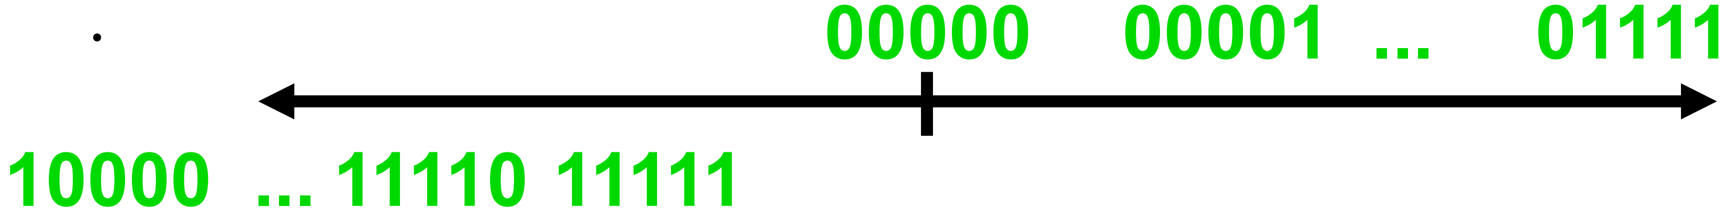
- We represent “things” in computers as particular bit patterns: N bits ⇒ 2^N things
- These 5 integer encodings have different benefits; 1s complement and sign/mag have most problems.
- unsigned (C99’s `uintN_t`) :



00000 00001 ... 01111 10000 ... 11111

- 2’s complement (C99’s `intN_t`) universal, learn!

•



00000 00001 ... 01111

10000 ... 11110 11111

- Overflow: numbers ∞; computers finite,errors!

META: Ain’t no free lunch

"Before this class, I (student) would say I am a solid C programmer"

a) **Strongly disagree** (never coded, and I *don't* know Java or C++)

b) **Mildly disagree** (never coded, but I *do* know Java and/or C++)

c) **Neutral** (I've coded *a little* in C)

d) **Mildly agree** (I've coded *a fair bit* in C)

e) **Strongly agree** (I've coded a *lot* in C)

"Before this class, I (student) would say I am a solid Java programmer"

a) **Strongly disagree** (never coded, and I *don't* know C or C++)

b) **Mildly disagree** (never coded, but I *do* know C and/or C++)

c) **Neutral** (I've coded *a little* in Java)

d) **Mildly agree** (I've coded *a fair bit* in Java)

e) **Strongly agree** (I've coded a *lot* in Java)

Has there been an update to ANSI C?

- Yes! It's called the "C99" or "C9x" std
  - You need "`gcc -std=c99`" to compile
- References

  `http://en.wikipedia.org/wiki/C99`

  `http://home.tiscalinet.ch/t_wolf/tw/c/c9x_changes.html`
- Highlights
  - Declarations in for loops, like Java (#15)
  - Java-like `//` comments (to end of line) (#10)
  - Variable-length non-global arrays (#33)
  - `<inttypes.h>`: explicit integer types (#38)
  - `<stdbool.h>` for boolean logic def's (#35)

Disclaimer

- Important: You will not learn how to fully code in C in these lectures! You'll still need your C reference for this course.
  - K&R is a must-have reference
    - Check online for more sources
  - "JAVA in a Nutshell," O'Reilly.
    - Chapter 2, "How Java Differs from C"
    - http://oreilly.com/catalog/javanut/excerpt/
  - Brian Harvey's course notes
    - On CS61C class website

Compilation : Overview

C *compilers* take C and convert it into an architecture specific machine code (string of 1s and 0s).

- Unlike Java which converts to architecture independent bytecode.
- Unlike most Scheme environments which interpret the code.
- These differ mainly in when your program is converted to machine instructions.
- For C, generally a 2 part process of compiling .c files to .o files, then linking the .o files into executables. Assembling is also done (but is hidden, i.e., done automatically, by default)

Compilation : Advantages

- **Great run-time performance**: generally much faster than Scheme or Java for comparable code (because it optimizes for a given architecture)
- **OK compilation time**: enhancements in compilation procedure (`Makefiles`) allow only modified files to be recompiled

Compilation : Disadvantages

- All compiled files (including the executable) are architecture specific, depending on *both* the CPU type and the operating system.
- Executable must be rebuilt on each new system.
  - Called "porting your code" to a new architecture.
- The "change→compile→run [repeat]" iteration cycle is slow

C Syntax: `main`

- To get the main function to accept arguments, use this:

```
int main (int argc, char *argv[])
```

- What does this mean?
  - `argc` will contain the number of strings on the command line (the executable counts as one, plus one for each argument). Here `argc` is 2:

```
unix% sort myFile
```

  - `argv` is a pointer to an array containing the arguments as strings (more on pointers later).

C Syntax: Variable Declarations

- Very similar to Java, but with a few minor but important differences
- All variable declarations must go before they are used (at the beginning of the block)*
- A variable may be initialized in its declaration; if not, it holds garbage!
- Examples of declarations:
  - correct: `{`

```
        int a = 0, b = 10;

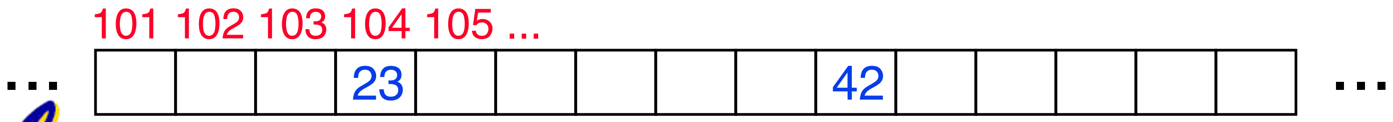
                ...
```

  - Incorrect:* `for (int i = 0; i < 10; i++)`

*C99 overcomes these limitations

Address vs. Value

- Consider memory to be a single huge array:
  - Each cell of the array has an address associated with it.
  - Each cell also stores some value.
  - Do you think they use signed or unsigned numbers? Negative address?!
- Don't confuse the address referring to a memory location with the value stored in that location.

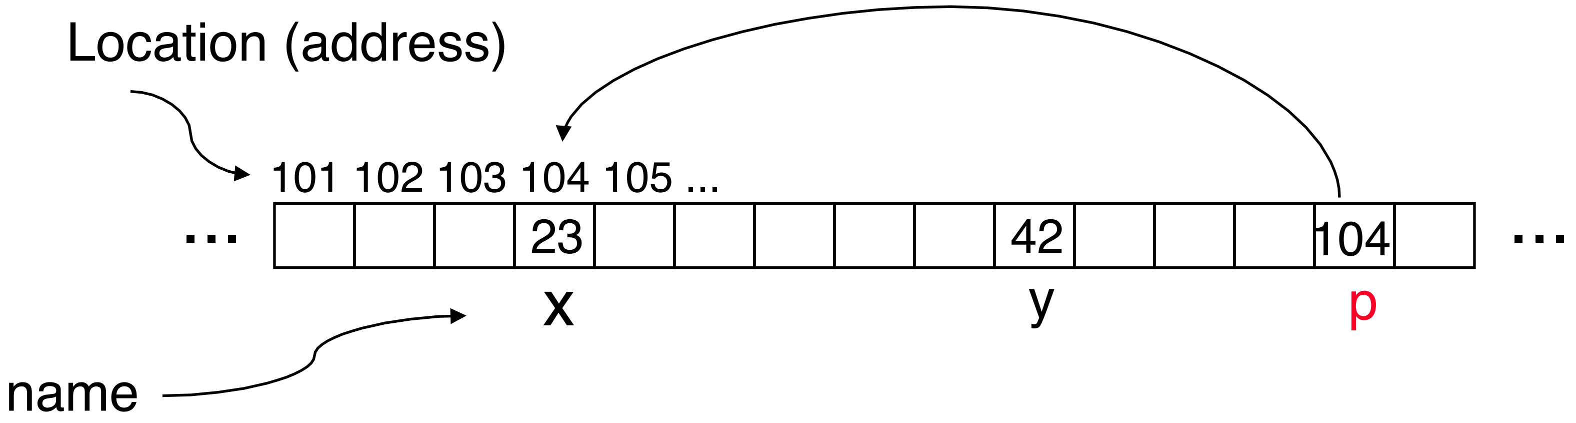


101 102 103 104 105 ...

... 23 42 ...

Pointers

- An address refers to a particular memory location. In other words, it points to a memory location.
- **Pointer**: A variable that contains the address of a variable.



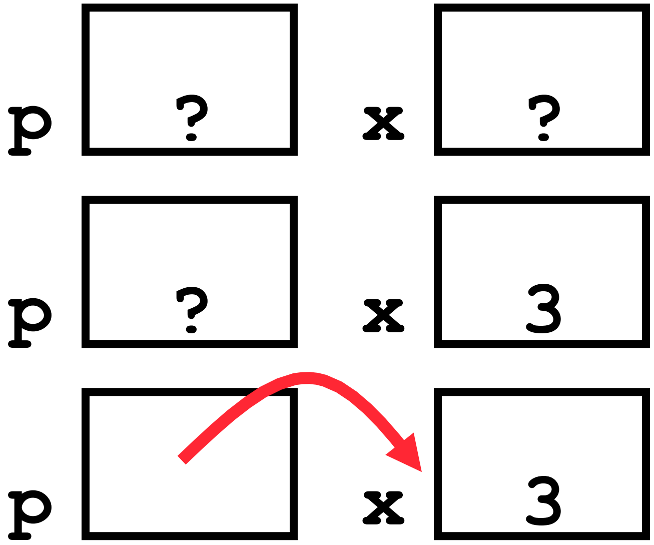
Pointers

- **How to create a pointer:**
  - `&` **operator: get address of a variable**

```
int *p, x;

    x = 3;

    p =&x;
```



Note the "*" gets used 2 different ways in this example. In the declaration to indicate that `p` is going to be a pointer, and in the `printf` to get the value pointed to by `p`.

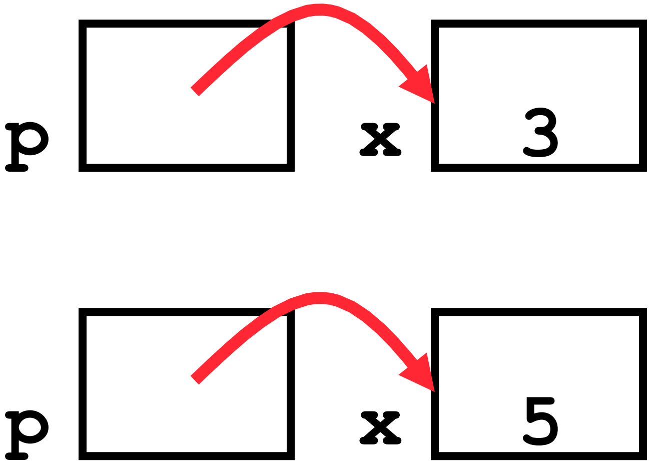
- **How get a value pointed to?**
  - `*` **"dereference operator": get value pointed to**

```
printf("p points to %d\n",*p);
```

Pointers

- How to change a variable pointed to?
  - Use dereference * operator on left of =

```
*p = 5;
```



Pointers and Parameter Passing

- Java and C pass parameters “by value”
  - procedure/function/method gets a copy of the parameter, so changing the copy cannot change the original

```
void addOne (int x) {
   x = x + 1;
}

int y = 3;

addOne(y);
```

`y` is still = 3

Pointers and Parameter Passing

- How to get a function to change a value?

```
void addOne (int *p) {
  *p = *p + 1;
}

int y = 3;

addOne(&y);
```

`y` is now = 4

Pointers

- Pointers are used to point to any data type (`int`, `char`, a `struct`, etc.).
- Normally a pointer can only point to one type (`int`, `char`, a `struct`, etc.).
  - `void *` is a type that can point to anything (generic pointer)
  - Use sparingly to help avoid program bugs… and security issues… and a lot of other bad things!

Peer Instruction Question

```
void main(); {
   int *p, x=5, y; // init
   y = *(p = &x) + 1;
   int z;
   flip-sign(p);
   printf("x=%d,y=%d,p=%d\n",x,y,p);
}
flip-sign(int *n){*n = -(*n)}
```

How many syntax+logic errors in this C99 code?

#Errors
a) 1
b) 2
c) 3
d) 4
e) 5

Peer Instruction Answer

```
void main(); {
   int *p, x=5, y; // init
   y = *(p = &x) + 1;
   int z;
   flip-sign(p);
   printf("x=%d,y=%d,p=%d\n",x,y,*p);
}
flip-sign(int *n){*n = -(*n);}
```

How many syntax+logic errors in this C99 code?

I get 5...
(signed ptr print is logical err)

```
#Errors
  a)1
  b)2
  c)3
  d)4
  e)5
```

And in conclusion…

- All declarations go at the beginning of each function except if you use C99.
- All data is in memory. Each memory location has an address to use to refer to it and a value stored in it.
- A pointer is a C version of the address.
  - * "follows" a pointer to its value
  - & gets the address of a value

C vs. Java™ Overview (1/2)

Java	C
Object-oriented (OOP)	No built-in object abstraction. Data separate from methods.
“Methods”	“Functions”
Class libraries of data structures	C libraries are lower-level
Automatic memory management	Manual memory management
	Pointers

C vs. Java™ Overview (2/2)

Java

- High memory overhead from class libraries
- Relatively Slow
- Arrays initialize to zero
- Syntax:

```
 /* comment */
// comment
System.out.print
```

C

- Low memory overhead
- Relatively Fast
- Arrays initialize to garbage
- Syntax: *

```
/* comment */
// comment
printf
```

* You need newer C compilers to allow Java style comments, or just use C99

C Syntax: True or False?

- What evaluates to FALSE in C?
  - 0 (integer)
  - NULL (pointer: more on this later)
  - no such thing as a Boolean*
- What evaluates to TRUE in C?
  - everything else…
  - (same idea as in scheme: only `#f` is false, everything else is true!)

*Boolean types provided by C99's `stdbool.h`

C syntax : flow control

- Within a function, remarkably close to Java constructs in methods (shows its legacy) in terms of flow control
  - `if-else`
  - `switch`
  - `while` and `for`
  - `do-while`
