

Lecture #2 – Number Representation

2014-01-24

There is one handout today at the entrance!

Senior Lecturer SOE Dan Garcia

www.cs.berkeley.edu/~ddgarcia

Great book =>
The Universal History
of Numbers

by Georges Ifrah

Review

• CS61C: Learn 6 great ideas in computer architecture to enable high performance programming via parallelism, not just learn C

1. Abstraction (Layers of Representation/Interpretation)
2. Moore's Law
3. Principle of Locality/Memory Hierarchy
4. Parallelism
5. Performance Measurement and Improvement
6. Dependability via Redundancy

Putting it all in perspective...

"If the automobile had followed the same development cycle as the computer,

– Robert X. Cringely

Data input: Analog → Digital

• Real world is analog!
• To import analog information, we must do two things

- Sample
 - E.g., for a CD, every 44,100ths of a second, we ask a music signal how loud it is.
- Quantize
 - For every one of these samples, we figure out where, on a 16-bit (65,536 tic-mark) "yardstick", it lies.

www.joshuadysart.com/journal/archives/digital_sampling.gif

Digital data not nec born Analog...

hof.povray.org

BIG IDEA: Bits can represent anything!!

- Characters?
 - 26 letters ⇒ 5 bits ($2^5 = 32$)
 - upper/lower case + punctuation ⇒ 7 bits (in 8) ("ASCII")
 - standard code to cover all the world's languages ⇒ 8,16,32 bits ("Unicode") www.unicode.com 
- Logical values?
 - 0 ⇒ False, 1 ⇒ True
- colors ? Ex: Red (00) Green (01) Blue (11)
- locations / addresses? commands?
- MEMORIZE: N bits ⇔ at most 2^N things

How many bits to represent π ?

- a) 1
- b) 9 ($\pi = 3.14$, so that's 011 "." 001 100)
- c) 64 (Since Macs are 64-bit machines)
- d) Every bit the machine has!
- e) ∞

What to do with representations of numbers?

• Just what we do with numbers!

- Add them
- Subtract them
- Multiply them
- Divide them
- Compare them

```

      1 1
      1 0 1 0
+   0 1 1 1
-----
      1 0 0 0 1
    
```

• Example: $10 + 7 = 17$

- ...so simple to add in binary that we can build circuits to do it!
- subtraction just as you would in decimal
- Comparison: How do you tell if $X > Y$?

What if too big?

- Binary bit patterns above are simply representatives of numbers. Abstraction! Strictly speaking they are called "numerals".
- Numbers really have an ∞ number of digits
 - with almost all being same (00...0 or 11...1) except for a few of the rightmost digits
 - Just don't normally show leading digits
- If result of add (or -, *, /) cannot be represented by these rightmost HW bits, overflow is said to have occurred.

How to Represent Negative Numbers?

(C's unsigned int, C99's uint_N_t)

• So far, unsigned numbers

• Obvious solution: define leftmost bit to be sign!

- 0 \rightarrow + 1 \rightarrow -
- Rest of bits can be numerical value of number

• Representation called sign and magnitude

Shortcomings of sign and magnitude?

- Arithmetic circuit complicated
 - Special steps depending whether signs are the same or not
- Also, two zeros
 - $0x00000000 = +0_{ten}$
 - $0x80000000 = -0_{ten}$
 - What would two 0s mean for programming?
- Also, incrementing "binary odometer", sometimes increases values, and sometimes decreases!

Therefore sign and magnitude abandoned

Administrivia

- Upcoming lectures
 - Next few lectures: Introduction to C
- Lab overcrowding
 - Remember, you can go to ANY discussion (none, or one that doesn't match with lab, or even more than one if you want)
 - Overcrowded labs - consider finishing at home and getting checkoffs in lab, or bringing laptop to lab
 - If you're checked off in 1st hour, you get an extra point on the labs!
 - TAs get 24x7 cardkey access (and will announce after-hours times)
- Enrollment
 - It will work out, don't worry
- Soda locks doors @ 6:30pm & on weekends
- Look at class website, piazza often!

<http://inst.eecs.berkeley.edu/~cs61c/piazza.com>

Great DeCal courses I supervise

- **UCBUGG (3 units, P/NP)**
 - UC Berkeley Undergraduate Graphics Group
 - TuTh 7-9pm in 200 Sutardja Dai
 - Learn to create a short 3D animation
 - No prereqs (but they might have too many students, so admission not guaranteed)
 - <http://ucbugg.berkeley.edu>
- **MS-DOS X (2 units, P/NP)**
 - Macintosh Software Developers for OS X
 - TuTh 5-7pm in 200 Sutardja Dai
 - Learn to program iOS devices!
 - No prereqs (other than interest)
 - <http://msdosx.berkeley.edu>

CS61C L02 Number Representation (13)

Garcia, Spring 2014 © UCB

Another try: complement the bits

• Example: $7_{10} = 00111_2$ $-7_{10} = 11000_2$

• Called **One's Complement**

• Note: positive numbers have leading 0s, negative numbers have leading 1s.

• What is -00000 ? Answer: 11111

• How many positive numbers in N bits?

CS61C L02 Number Representation (14)

Garcia, Spring 2014 © UCB

Shortcomings of One's complement?

- Arithmetic still a somewhat complicated.
- Still two zeros
 - $0x00000000 = +0_{ten}$
 - $0xFFFFFFF = -0_{ten}$
- Although used for a while on some computer products, one's complement was eventually abandoned because another solution was better.

CS61C L02 Number Representation (15)

Garcia, Spring 2014 © UCB

Standard Negative # Representation

• Problem is the negative mappings "overlap" with the positive ones (the two 0s). Want to shift the negative mappings left by one.

• Solution! For negative numbers, complement, then add 1 to the result

• As with sign and magnitude, & one's compl. leading 0s \Rightarrow positive, leading 1s \Rightarrow negative

• $000000...xxx$ is ≥ 0 , $111111...xxx$ is < 0

• except $1...1111$ is -1, not -0 (as in sign & mag.)

• This representation is Two's Complement

• This makes the hardware simple!

(C's int, aka a "signed integer")

(Also C's short, long long, ..., C99's intN t)

CS61C L02 Number Representation (16)

Garcia, Spring 2014 © UCB

Two's Complement Formula

• Can represent positive and negative numbers in terms of the bit value times a power of 2:

$$d_{31} \times (-2^{31}) + d_{30} \times 2^{30} + \dots + d_2 \times 2^2 + d_1 \times 2^1 + d_0 \times 2^0$$

• Example: 1101_{two} in a nibble?

$$= 1x(-2^3) + 1x2^2 + 0x2^1 + 1x2^0$$

$$= -2^3 + 2^2 + 0 + 2^0$$

$$= -8 + 4 + 0 + 1$$

$$= -8 + 5$$

$$= -3_{ten}$$

Example: -3 to +3 to -3 (again, in a nibble):

x	:	1101	<small>two</small>
x'	:	0010	<small>two</small>
+1	:	0011	<small>two</small>
()'	:	1100	<small>two</small>
+1	:	1101	<small>two</small>

CS61C L02 Number Representation (17)

Garcia, Spring 2014 © UCB

2's Complement Number "line": N = 5

CS61C L02 Number Representation (18)

Garcia, Spring 2014 © UCB

How best to represent -12.75?

- 2s Complement (but shift binary pt)
- Bias (but shift binary pt)
- Combination of 2 encodings
- Combination of 3 encodings
- We can't

Shifting binary point means "divide number by some power of 2. E.g., $11_{10} = 1011.0_2$ so $(11/4)_{10} = 2.75_{10} = 10.110_2$

CS51C L02 Number Representation (20) Garcia, Spring 2014 © UCB

And in summary...

META: We often make design decisions to make HW simple

- We represent "things" in computers as particular bit patterns: N bits $\Rightarrow 2^N$ things
- These 5 integer encodings have different benefits; 1s complement and sign/mag have most problems.
- unsigned (C99's uintN_t):

00000 00001 ... 01111 10000 ... 11111

- 2's complement (C99's intN_t) universal, learn!

10000 ... 11110 11111

- Overflow: numbers ∞ ; computers finite, errors!

META: Ain't no free lunch

CS51C L02 Number Representation (21) Garcia, Spring 2014 © UCB

REFERENCE: Which base do we use?

- Decimal: great for humans, especially when doing arithmetic
- Hex: if human looking at long strings of binary numbers, its much easier to convert to hex and look 4 bits/symbol
 - Terrible for arithmetic on paper
- Binary: what computers use; you will learn how computers do +, -, *, /
 - To a computer, numbers always binary
 - Regardless of how number is written:
 - $32_{ten} == 32_{10} == 0x20 == 100000_2 == 0b100000$
 - Use subscripts "ten", "hex", "two" in book, slides when might be confusing

CS51C L02 Number Representation (22) Garcia, Spring 2014 © UCB

Two's Complement for N=32

0000 ... 0000 0000 0000 0000	_{two} =	0	_{ten}
0000 ... 0000 0000 0000 0001	_{two} =	1	_{ten}
0000 ... 0000 0000 0000 0010	_{two} =	2	_{ten}
...			
0111 ... 1111 1111 1111 1101	_{two} =	2,147,483,645	_{ten}
0111 ... 1111 1111 1111 1110	_{two} =	2,147,483,646	_{ten}
0111 ... 1111 1111 1111 1111	_{two} =	2,147,483,647	_{ten}
1000 ... 0000 0000 0000 0000	_{two} =	-2,147,483,648	_{ten}
1000 ... 0000 0000 0000 0001	_{two} =	-2,147,483,647	_{ten}
1000 ... 0000 0000 0000 0010	_{two} =	-2,147,483,646	_{ten}
...			
1111 ... 1111 1111 1111 1101	_{two} =	-3	_{ten}
1111 ... 1111 1111 1111 1110	_{two} =	-2	_{ten}
1111 ... 1111 1111 1111 1111	_{two} =	-1	_{ten}

- One zero; 1st bit called sign bit
- 1 "extra" negative: no positive 2,147,483,648_{ten}

CS51C L02 Number Representation (23) Garcia, Spring 2014 © UCB

Two's comp. shortcut: Sign extension

- Convert 2's complement number rep. using n bits to more than n bits
- Simply replicate the most significant bit (sign bit) of smaller to fill new bits
 - 2's comp. positive number has infinite 0s
 - 2's comp. negative number has infinite 1s
 - Binary representation hides leading bits; sign extension restores some of them
 - 16-bit -4_{ten} to 32-bit:

1111 1111 1111 1100_{two}

1111 1111 1111 1111 1111 1111 1111 1100_{two}

CS51C L02 Number Representation (24) Garcia, Spring 2014 © UCB
