 2014-02-21

  
 Guest Lecturer  
 Alan Christopher

**MEMRISTOR MEMORY ON ITS WAY (HOPEFULLY)**

HP has begun testing research prototypes of a novel non-volatile memory element, the memristor. They have double the storage density of flash, and has 10x more read-write cycles than flash ( $10^6$  vs  $10^5$ ). Memristors are (in principle) also capable of being memory and logic, how cool is that? Originally slated to be ready by 2013, HP later pushed that date to some time 2014.

**Review: New-School Machine Structures**

**Software**

- Parallel Requests  
Assigned to computer  
e.g., Search "Katz"
- Parallel Threads  
Assigned to core  
e.g., Lookup, Ads
- Parallel Instructions  
>1 instruction @ one time  
e.g., 5 pipelined instructions
- Parallel Data  
>1 data item @ one time  
e.g., Add of 4 pairs of words
- Hardware descriptions  
All gates @ one time
- Programming Languages

**Hardware**

Warehouse Scale Computer

Smart Phone

**Harness Parallelism & Achieve High Performance**

Computer

Core (Cache) Core

Memory Input/Output Core

Functional Unit(s)

Cache Memory

Logic Gates

Fall 2012 -- Lecture #14  
 2/19/2014

**Review: Direct-Mapped Cache**

- All fields are read as unsigned integers.
- Index
  - specifies the cache index (or "row"/block)
- Tag
  - distinguishes betw the addresses that map to the same location
- Offset
  - specifies which byte within the block we want

tag to check if have correct block

index to select block

byte offset within block

Cal CS61C L31 Caches II (3) Garcia, Spring 2013 © UCB

**TIO Dan's great cache mnemonic**

**AREA** (cache size, B)  
 = HEIGHT (# of blocks) \* WIDTH (size of one block, B/block)

$2^{(H+W)} = 2^H * 2^W$

Tag Index Offset

Addr size (often 32 bits)

HEIGHT (# of blocks)

WIDTH (size of one block, B/block)

AREA (cache size, B)

Cal CS61C L31 Caches II (4) Garcia, Spring 2013 © UCB

**Memory Access without Cache**

- Load word instruction: lw \$t0, 0(\$t1)
- \$t1 contains  $1022_{ten}$ , Memory[1022] = 99

- Processor issues address  $1022_{ten}$  to Memory
- Memory reads word at address  $1022_{ten}$  (99)
- Memory sends 99 to Processor
- Processor loads 99 into register \$t1

Cal CS61C L31 Caches II (5) Garcia, Spring 2013 © UCB

**Memory Access with Cache**

- Load word instruction: lw \$t0, 0(\$t1)
- \$t1 contains  $1022_{ten}$ , Memory[1022] = 99
- With cache (similar to a hash)
  - Processor issues address  $1022_{ten}$  to Cache
  - Cache checks to see if has copy of data at address  $1022_{ten}$ 
    - If finds a match (Hit): cache reads 99, sends to processor
    - No match (Miss): cache sends address 1022 to Memory
      - Memory reads 99 at address  $1022_{ten}$
      - Memory sends 99 to Cache
      - Cache replaces word with new 99
      - Cache sends 99 to processor
  - Processor loads 99 into register \$t1

Cal CS61C L31 Caches II (6) Garcia, Spring 2013 © UCB

## Caching Terminology

- When reading memory, 3 things can happen:
  - cache hit: cache block is valid and contains proper address, so read desired word
  - cache miss: nothing in cache in appropriate block, so fetch from memory
  - cache miss, block replacement: wrong data is in cache at appropriate block, so discard it and fetch desired data from memory (cache always copy)

## Cache Terms

- Hit rate: fraction of access that hit in the cache
- Miss rate: 1 – Hit rate
- Miss penalty: time to replace a block from lower level in memory hierarchy to cache
- Hit time: time to access cache memory (including tag comparison)
- Abbreviation: “\$” = cache (A Berkeley innovation!)

## Accessing data in a direct mapped cache

- Ex.: 16KB of data, direct-mapped, 4 word blocks
    - Can you work out height, width, area?
  - Read 4 addresses
    1. 0x00000014
    2. 0x0000001C
    3. 0x00000034
    4. 0x00000014
- Memory
- | Address (hex) | Value of Word |
|---------------|---------------|
| 00000010      | a             |
| 00000014      | b             |
| 00000018      | c             |
| 0000001C      | d             |
| ...           | ...           |
| 00000030      | e             |
| 00000034      | f             |
| 00000038      | g             |
| 0000003C      | h             |
| ...           | ...           |
| 00008010      | i             |
| 00008014      | j             |
| 00008018      | k             |
| 0000801C      | l             |
| ...           | ...           |
- Memory vals here:

## Accessing data in a direct mapped cache

- 4 Addresses:
    - 0x00000014, 0x0000001C, 0x00000034, 0x00000014
  - 4 Addresses divided (for convenience) into Tag, Index, Byte Offset fields
- |                      |            |        |
|----------------------|------------|--------|
| 00000000000000000000 | 0000000001 | 0100   |
| 00000000000000000000 | 0000000001 | 1100   |
| 00000000000000000000 | 0000000011 | 0100   |
| 00000000000000000010 | 0000000001 | 0100   |
| Tag                  | Index      | Offset |

## 16 KB Direct Mapped Cache, 16B blocks

- Valid bit: determines whether anything is stored in that row (when computer initially turned on, all entries invalid)

| Valid | Tag | 0xc-f | 0x8-b | 0x4-7 | 0x0-3 |
|-------|-----|-------|-------|-------|-------|
| 0     | 0   |       |       |       |       |
| 1     | 0   |       |       |       |       |
| 2     | 0   |       |       |       |       |
| 3     | 0   |       |       |       |       |
| 4     | 0   |       |       |       |       |
| 5     | 0   |       |       |       |       |
| 6     | 0   |       |       |       |       |
| 7     | 0   |       |       |       |       |
| ...   | ... |       |       |       |       |
| 1022  | 0   |       |       |       |       |
| 1023  | 0   |       |       |       |       |

## 1. Read 0x00000014

- 00000000000000000000 0000000001 0100

| Valid | Tag | 0xc-f | 0x8-b | 0x4-7 | 0x0-3 |
|-------|-----|-------|-------|-------|-------|
| 0     | 0   |       |       |       |       |
| 1     |     |       |       |       |       |
| 2     | 0   |       |       |       |       |
| 3     |     |       |       |       |       |
| 4     | 0   |       |       |       |       |
| 5     | 0   |       |       |       |       |
| 6     | 0   |       |       |       |       |
| 7     | 0   |       |       |       |       |
| ...   | ... |       |       |       |       |
| 1022  | 0   |       |       |       |       |
| 1023  | 0   |       |       |       |       |

So we read block 1 (0000000001)

▪ 000000000000000000 0000000001 0100

Valid Tag field Index field Offset

| Index | Valid | Tag | 0xc-f | 0x8-b | 0x4-7 | 0x0-3 |
|-------|-------|-----|-------|-------|-------|-------|

## Answers

- **0x00000030 a hit**  
Index = 3, Tag matches,  
Offset = 0, value = e
- **0x0000001c a miss**  
Index = 1, Tag mismatch,  
so replace from memory,  
Offset = 0xc, value = d
- Since reads, values  
must = memory values  
whether or not cached:
  - 0x00000030 = e
  - 0x0000001c = d

| Address (hex) | Value of Word |
|---------------|---------------|
| ...           | ...           |
| 00000010      | a             |
| 00000014      | b             |
| 00000018      | c             |
| 0000001c      | d             |
| ...           | ...           |
| 00000030      | e             |
| 00000034      | f             |
| 00000038      | g             |
| 0000003c      | h             |
| ...           | ...           |
| 00008010      | i             |
| 00008014      | j             |
| 00008018      | k             |
| 0000801c      | l             |
| ...           | ...           |

## Administrivia

- Proj 1-2 due Sunday

## Multiword-Block Direct-Mapped Cache

- Four words/block, cache size = 4K words

What kind of locality are we taking advantage of?

## Peer Instruction

- 1) Mem hierarchies were invented before 1950. (UNIVAC I wasn't delivered 'til 1951)
- 2) All caches take advantage of spatial locality.
- 3) All caches take advantage of temporal locality.

- 123  
 a) FFF  
 a) FFT  
 b) FTF  
 b) FTT  
 c) TFF  
 d) TFT  
 e) TTF  
 e) TTT

## And in Conclusion...

- Mechanism for transparent movement of data among levels of a storage hierarchy
  - set of address/value bindings
  - address  $\Rightarrow$  index to set of candidates
  - compare desired address with tag
  - service hit or miss
    - load new block and binding on miss

address: tag index offset  
 00000000000000000000 0000000001 1100

| Valid | Tag | 0xc-f | 0x8-b | 0x4-7 | 0x0-3 |
|-------|-----|-------|-------|-------|-------|
| 1     | 0   | d     | c     | b     | a     |
|       |     |       |       |       |       |
|       |     |       |       |       |       |
|       |     |       |       |       |       |
