Review

- C99 is the update to the ANSI standard
- Pointers and arrays are **virtually same**
- C knows how to **increment pointers**
- C is an efficient language, w/little protection
 - Array bounds **not checked**
 - Variables **not** automatically initialized
- (Beware) The cost of efficiency is more overhead for the programmer.
 - “C gives you a lot of extra rope but be careful not to hang yourself with it!”
- Use handles to change pointers
- P. 53 is a precedence table, useful for (e.g.,)

CS61C L4 C Memory Management (2)

• $x = ++*p$; $\Rightarrow *p = *p + 1$; $x = *p$;

C structures : Overview

- A **struct** is a data structure composed for simpler data types.
 - Like a class in Java/C++ but without methods or inheritance.

```
struct point {  
    int x;  
    int y;  
};  
void PrintPoint(struct point p)  
{  
    printf("( %d, %d)", p.x, p.y);  
}
```

CS61C L4 C Memory Management (4)

Beamer, Summer 2007 © UCB

C structures: Pointers to them

- The C arrow operator (**->**) dereferences and extracts a structure field with a single operator.
- The following are equivalent:

```
struct point *p;  
  
printf("x is %d\n", (*p).x);  
printf("x is %d\n", p->x);
```

CS61C L4 C Memory Management (5)

Beamer, Summer 2007 © UCB

How big are structs?

- Recall C operator **sizeof()** which gives size in bytes (of type or variable)
- How big is **sizeof(p)** ?

```
struct p {  
    char x;  
    int y;  
};  
  
• 5 bytes? 8 bytes?  
• Compiler may word align integer y
```

CS61C L4 C Memory Management (6)

Linked List Example

- Let's look at an example of using structures, pointers, malloc(), and free() to implement a linked list of strings.

```
struct Node {
    char *value;
    struct Node *next;
};
typedef struct Node *List;

/* Create a new (empty) list */
List ListNew(void)
{ return NULL; }
```

CS61C L4 C Memory Management (7)

Beamer, Summer 2007 © UCB

Linked List Example

```
/* add a string to an existing list */
List list_add(List list, char *string)
{
    struct Node *node =
        (struct Node*) malloc(sizeof(struct Node));
    node->value =
        (char*) malloc(strlen(string) + 1);
    strcpy(node->value, string);
    node->next = list;
    return node;
}
```

CS61C L4 C Memory Management (8)

Beamer, Summer 2007 © UCB

Linked List Example

```
/* add a string to an existing list */
List list_add(List list, char *string)
{
    struct Node *node =
        (struct Node*) malloc(sizeof(struct Node));
    node->value =
        (char*) malloc(strlen(string) + 1);
    strcpy(node->value, string);
    node->next = list;
    return node;
}
```

CS61C L4 C Memory Management (9)

Beamer, Summer 2007 © UCB

Linked List Example

```
/* add a string to an existing list */
List list_add(List list, char *string)
{
    struct Node *node =
        (struct Node*) malloc(sizeof(struct Node));
    node->value =
        (char*) malloc(strlen(string) + 1);
    strcpy(node->value, string);
    node->next = list;
    return node;
}
```

CS61C L4 C Memory Management (10)

Beamer, Summer 2007 © UCB

Linked List Example

```
/* add a string to an existing list */
List list_add(List list, char *string)
{
    struct Node *node =
        (struct Node*) malloc(sizeof(struct Node));
    node->value =
        (char*) malloc(strlen(string) + 1);
    strcpy(node->value, string);
    node->next = list;
    return node;
}
```

CS61C L4 C Memory Management (11)

Beamer, Summer 2007 © UCB

Linked List Example

```
/* add a string to an existing list */
List list_add(List list, char *string)
{
    struct Node *node =
        (struct Node*) malloc(sizeof(struct Node));
    node->value =
        (char*) malloc(strlen(string) + 1);
    strcpy(node->value, string);
    node->next = list;
    return node;
}
```

CS61C L4 C Memory Management (12)

Beamer, Summer 2007 © UCB

Linked List Example

```

/* add a string to an existing list */
List list_add(List list, char *string)
{
    struct Node *node =
        (struct Node*) malloc(sizeof(struct Node));
    node->value =
        (char*) malloc(strlen(string) + 1);
    strcpy(node->value, string);
    node->next = list;
    return node;
}

```

CS61C L4 C Memory Management (13)

Beamer, Summer 2007 © UCB

“And in Semi-Conclusion...”

- Use handles to change pointers
- Create abstractions with structures
- Dynamically allocated heap memory must be manually deallocated in C.
 - Use malloc() and free() to allocate and deallocate memory from heap.

CS61C L4 C Memory Management (14)

Beamer, Summer 2007 © UCB

Peer Instruction

Which are guaranteed to print out 5?

```

I: main() {
    int *a_ptr; *a_ptr = 5; printf("%d", *a_ptr); }

II: main() {
    int *p, a = 5;
    p = &a; ...
    /* code; a & p NEVER on LHS of = */
    printf("%d", a); }

III: main() {
    int *ptr;
    ptr = (int *) malloc (sizeof(int));
    *ptr = 5;
    printf("%d", *ptr); }

```

	I	II	III
1:	-	-	-
2:	-	-	YES
3:	-	YES	-
4:	-	YES	YES
5:	YES	-	-
6:	YES	-	YES
7:	YES	YES	-
8:	YES	YES	YES

CS61C L4 C Memory Management (15)

Beamer, Summer 2007 © UCB

Peer Instruction

```

int main(void) {
    int A[] = {5, 10};
    int *p = A;
    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
    p = p + 1;
    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
    *p = *p + 1;
    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
}

```

If the first printf outputs 100 5 5 10, what will the other two printf output?

- 1: 101 10 5 10 then 101 11 5 11
- 2: 104 10 5 10 then 104 11 5 11
- 3: 101 <other> 5 10 then 101 <3-others>
- 4: 104 <other> 5 10 then 104 <3-others>
- 5: One of the two printf causes an ERROR
- 6: I surrender!

CS61C L4 C Memory Management (16)

Administrivia

- Assignments
 - HW1 due 7/1 @ 11:59pm
 - HW2 due 7/4 @ 11:59pm
- No class on 7/4
- Another section is in the works
 - It won't be official until the last minute
 - Keep checking the course website
 - Once known I will email people on waitlist

CS61C L4 C Memory Management (17)

Beamer, Summer 2007 © UCB

Where is data allocated?

- Structure declaration **does not** allocate memory
- Variable declaration **does** allocate memory
 - If declare **outside** a procedure, allocated in static storage
 - If declare **inside** procedure, allocated on the stack and freed when procedure returns.
 - NB: main() is a procedure

```

int myGlobal;
main() {
    int myTemp;
}

```

CS61C L4 C Memory Management (18)

Beamer, Summer 2007 © UCB

The Stack

- Stack frame includes:
 - Return address
 - Parameters
 - Space for other local variables
- Stack frames contiguous blocks of memory; stack pointer tells where top stack frame is
- When procedure ends, stack frame is tossed off the stack; frees memory for future stack frames

Stack

- Last In, First Out (LIFO) memory usage

```
main ()
{ a(0);
}
void a (int m)
{ b(1);
}
void b (int n)
{ c(2);
}
void c (int o)
{ d(3);
}
void d (int p)
{
}
```

Who cares about stack management?

- Pointers in C allow access to deallocated memory, leading to hard-to-find bugs!

```
int * ptr () {
  int y;
  y = 3;
  return &y;
};
main () {
  int *stackAddr, content;
  stackAddr = ptr();
  content = *stackAddr;
  printf("%d", content); /* 3 */
  content = *stackAddr;
  printf("%d", content); /*13451514 */
}
```

C Memory Management

- C has 3 pools of memory
 - Static storage:** global variable storage, basically permanent, entire program run
 - The Stack:** local variable storage, parameters, return address (location of "activation records" in Java or "stack frame" in C)
 - The Heap** (dynamic storage): data lives until deallocated by programmer
- C requires knowing where objects are in memory, otherwise things don't work as expected
 - Java hides location of objects

The Heap (Dynamic memory)

- Large pool of memory, **not** allocated in contiguous order
 - back-to-back requests for heap memory could result blocks very far apart
 - where Java **new** command allocates memory
- In C, specify number of **bytes** of memory explicitly to allocate item

```
int *ptr;
ptr = (int *) malloc(sizeof(int));
/* malloc returns type (void *),
so need to cast to right type */
```

- malloc():** Allocates raw, uninitialized memory from heap

Review: Normal C Memory Management

- A program's **address space** contains 4 regions:

- stack:** local variables, grows downward
- heap:** space requested for pointers via `malloc()`; resizes dynamically, grows upward
- static data:** variables declared outside main, does not grow or shrink
- code:** loaded when program starts, does not change

For now, OS somehow prevents accesses between stack and heap (gray hash lines). Wait for virtual memory

Intel 80x86 C Memory Management

• A C program's 80x86 address space :

- **heap**: space requested for pointers via `malloc()`; resizes dynamically, grows upward
- **static data**: variables declared outside main, does not grow or shrink
- **code**: loaded when program starts, does not change
- **stack**: local variables, grows downward

CS61C L4 C Memory Management (25)

Beamer, Summer 2007 © UC

Memory Management

- How do we manage memory?
- **Code, Static storage are easy**: they never grow or shrink
- **Stack space is also easy**: stack frames are created and destroyed in last-in, first-out (LIFO) order
- **Managing the heap is tricky**: memory can be allocated / deallocated at any time

CS61C L4 C Memory Management (26)

Beamer, Summer 2007 © UC

Heap Management Requirements

- Want `malloc()` and `free()` to run quickly.
- Want minimal memory overhead
- Want to avoid **fragmentation** – when most of our free memory is in many small chunks
 - In this case, we might have many free bytes but not be able to satisfy a large request since the free bytes are not contiguous in memory.

CS61C L4 C Memory Management (27)

Beamer, Summer 2007 © UC

Heap Management

- An example
 - Request R1 for 100 bytes
 - Request R2 for 1 byte
 - Memory from R1 is freed
 - Request R3 for 50 bytes

CS61C L4 C Memory Management (28)

Beamer, Summer 2007 © UC

Heap Management

- An example
 - Request R1 for 100 bytes
 - Request R2 for 1 byte
 - Memory from R1 is freed
 - Request R3 for 50 bytes

CS61C L4 C Memory Management (29)

Beamer, Summer 2007 © UC

K&R Malloc/Free Implementation

- From Section 8.7 of K&R
 - Code in the book uses some C language features we haven't discussed and is written in a very terse style, don't worry if you can't decipher the code
- Each block of memory is preceded by a header that has two fields:
 - **size** of the block and
 - **pointer to the next block**
- All **free blocks** are kept in a linked list, the pointer field is unused in an allocated block

CS61C L4 C Memory Management (30)

Beamer, Summer 2007 © UC

K&R Implementation

- `malloc()` searches the free list for a block that is big enough. If none is found, more memory is requested from the operating system. If what it gets can't satisfy the request, it fails.
- `free()` checks if the blocks adjacent to the freed block are also free
 - If so, adjacent free blocks are merged (**coalesced**) into a single, larger free block
 - Otherwise, the freed block is just added to the free list

Choosing a block in `malloc()`

- If there are multiple free blocks of memory that are big enough for some request, how do we choose which one to use?
 - **best-fit**: choose the smallest block that is big enough for the request
 - **first-fit**: choose the first block we see that is big enough
 - **next-fit**: like first-fit but remember where we finished searching and resume searching from there

Peer Instruction – Pros and Cons of fits

- A. The con of **first-fit** is that it results in many **small blocks** at the beginning of the free list
- B. The con of **next-fit** is it is **slower than first-fit**, since it takes longer in steady state to find a match
- C. The con of **best-fit** is that it **leaves lots of tiny blocks**

	ABC
1:	FFF
2:	FFT
3:	FTF
4:	FTT
5:	TFF
6:	TFT
7:	TTF
8:	TTT

Tradeoffs of allocation policies

- **Best-fit**: Tries to limit fragmentation but at the cost of time (must examine all free blocks for each `malloc()`). Leaves lots of small blocks (why?)
- **First-fit**: Quicker than best-fit (why?) but potentially more fragmentation. Tends to concentrate small blocks at the beginning of the free list (why?)
- **Next-fit**: Does not concentrate small blocks at front like first-fit, should be faster as a result.

And in conclusion...

- C has 3 pools of memory
 - **Static storage**: global variable storage, basically permanent, entire program run
 - **The Stack**: local variable storage, parameters, return address
 - **The Heap** (dynamic storage): `malloc()` grabs space from here, `free()` returns it.
- `malloc()` handles free space with freelist. Three different ways to find free space when given a request:
 - **First fit** (find first one that's free)
 - **Next fit** (same as first, but remembers where left off)
 - **Best fit** (finds most "snug" free space)
