Peer Instruction Question 1

```c
int *p;
p = 5;
printf("%d\n", *p);
```

What is the result from executing this code?

a) Prints 5
b) Prints garbage
c) Always crashes.
d) Almost always crashes.
Peer Instruction Answer 1

```c
int *p;
*p = 5;
printf("%d\n", *p);
```

What is the result from executing this code?

a) Prints 5  

b) Prints garbage  

c) Always crashes.  

d) Almost always crashes.

- Uninitialized variables contain garbage, 
p may point to an invalid memory address.  
- Trying to write to an invalid address will crash program (segmentation fault).  
- There’s a (very) small chance p may just happen to contain a valid address.
void main() { 
    int *p, x=5, y; // init
    y = *(p = &x) + 1;
    int z;
    flip-sign(p);
    printf("x=%d, y=%d, p=%d\n", x, y, p);
}

flip-sign(int *n){*n = -(n)}

How many syntax + logic errors in this C code?
#insert <stdio.h>

```c
void main() {
    int *p, x=5, y; // init
    y = *(p = &x) + 1;
    int z;
    flip-sign(p);
    printf("x=%d, y=%d, p=%d\n", x, y, *p);
}
flip-sign(int *n){*n = -(n);}
```

How many syntax + logic errors in this C code?

6/22/2011
Pointers

• Pointers are used to point to any kind of data (int, char, a struct, etc.)

• Normally a pointer only points to one type (int, char, a struct, etc.).
  – void * is a type that can point to anything (generic pointer)
  – Use sparingly to help avoid program bugs, and security issues, and other bad bad things!
Pointers and Structures

typedef struct {
    int x;
    int y;
} Point;

Point p1;
Point p2;
Point* paddr;

/* dot notation */
int h = p1.x;
p2.y = p1.y;

/* arrow notation
   these lines are equivalent */
int h = (*paddr).x;
int h = paddr->x;
Pointers Summary

• Why use pointers?
  – If we want to pass a large struct or array, it’s easier / faster / etc. to pass a pointer than the whole thing
  – In general, pointers allow cleaner, more compact code

• So what are the drawbacks?
  – Pointers are probably the single largest source of bugs in C, so be careful anytime you deal with them
    • Most problematic with dynamic memory management—which you will to know by the end of the semester, but not for the projects (there will be a lab later in the semester)
    • *Dangling references* and *memory leaks*
Agenda

• C and Pointer review
• Arrays
• Adminstrivia
• Pointer Arithmetic
• Break
• Pointer Misc
• Pointer Problems
• Summary
Arrays (1/5)

• Declaration:
  
  int ar[2];

  declares a 2-element integer array: just a block of memory

  int ar[] = {795, 635};

  declares and initializes a 2-element integer array

• Accessing elements:
  
  ar[num]

  returns the num\textsuperscript{th} element
Arrays (2/5)

• Arrays are (almost) identical to pointers
  – `char *string` and `char string[]` are nearly identical declarations
  – Differ in subtle ways: incrementing, declaration of filled arrays

• Key Concept: Array variable is a “pointer” to the first (0\textsuperscript{th}) element
Arrays (3/5)

• Consequences:
  – ar is an array variable, but looks like a pointer
  – ar[0] is the same as *ar
  – ar[2] is the same as *(ar+2)
  – We can use pointer arithmetic to conveniently access arrays

• An array variable is read-only
  – Cannot say “ar = [anything]”

• Declared arrays are only allocated while the scope is valid

```c
char *foo() {
    char string[32]; ...;
    return string;
}
```

is incorrect and very very bad
Arrays (4/5)

- Array size $n$; want to access from 0 to $n-1$, so you should use counter AND utilize a variable for declaration & incrementation
  - Bad pattern
    ```
    int i, ar[10];
    for(i = 0; i < 10; i++) { ... }
    ```
  - Better pattern
    ```
    int ARRAY_SIZE = 10
    int i, a[ARRAY_SIZE];
    for(i = 0; i < ARRAY_SIZE; i++) { ... }
    ```

- SINGLE SOURCE OF TRUTH
  - You’re utilizing indirection and avoiding maintaining two copies of the number 10
Arrays (5/5)

• Pitfall: An array in C does not know its own length, and its bounds are not checked!
  – Consequence: We can accidentally access off the end of an array
  – Consequence: We must pass the array and its size to any procedure that is going to manipulate it

• Segmentation faults and bus errors:
  – These are VERY difficult to find; be careful! (You’ll learn how to debug these in lab)
Array Summary

- Array indexing is syntactic sugar for pointers
- \texttt{a[i]} is treated as \texttt{*(a+i)}
- E.g., three equivalent ways to zero an array:
  - \texttt{for (i=0; i < size; i++) a[i] = 0;}
  - \texttt{for (i=0; i < size; i++) *(a+i) = 0;}
  - \texttt{for (p=a; p < a+size; p++) *p = 0;}
C Strings

• String in C is just an array of characters
  
  ```
  char string[] = "abc";
  ```

• How do you tell how long a string is?
  
  – Last character is followed by a 0 byte (aka “null terminator”)
    
    ```
    int strlen(char s[])
    {
      int n = 0;
      while (s[n] != 0) n++;
      return n;
    }
    ```
C String Standard Functions

- `int strlen(char *string);`
  - Compute the length of string

- `int strcmp(char *str1, char *str2);`
  - Return 0 if `str1` and `str2` are identical (how is this different from `str1 == str2`?)

- `char *strcpy(char *dst, char *src);`
  - Copy contents of string `src` to the memory at `dst`. Caller must ensure that `dst` has enough memory to hold the data to be copied
  - Note: `dst = src` only copies pointers, not string itself

Administrivia

• Give your consent forms to your TA in discussion or lab.
• HW 1 has been posted – get started if you haven’t already.
• Lab 2 has been posted.
Agenda

• C and Pointer review
• Arrays
• Administrivia
• Pointer Arithmetic
• Break
• Pointer Misc
• Pointer Problems
• Summary
Arrays as Arguments

Passing arrays:

```c
int foo(int array[], unsigned int size) {
    ...
    array[size - 1] ...
}

int main(void) {
    int a[10], b[5];
    ...
    foo(a, 10)...
    foo(b, 5) ...
}
```

• An array is passed to a function as a pointer
  – The array size is lost!

Really int *array

Must explicitly pass the size
Arrays as Arguments

```c
int foo(int array[], unsigned int size) {
    ...
    printf("%d\n", sizeof(array));
}

int main(void) {
    int a[10], b[5];
    ...
    foo(a, 10)...
    foo(b, 5) ...
    printf("%d\n", sizeof(a));
}
```

What does this print? 8
... because array is really a pointer (and a pointer is architecture dependent, but likely to be 8 on modern machines!)

What does this print? 40
Pointer Arithmetic

pointer + number, pointer – number

E.g., pointer + 1 adds 1 something to a pointer

(in both examples, pretend variable a sits at address 100)

```
char *p;
char a;
p = &a;
```

```
int *p;
int a;
p = &a;
```

What does the following line yield?
```
printf("%u %u\n", p, p+1);
```

100 101

100 104

Adds 1* sizeof(char) to the memory address

Adds 1* sizeof(int) to the memory address

*Pointer arithmetic should be used cautiously*
Pointer Arithmetic

• Since a pointer is just a memory address, we can add to it to step through an array
• \( p+1 \) correctly computes a ptr to the next array element automatically depending on `sizeof(type)`
• What if we have an array of large structs (objects)?
  – C takes care of it in the same way it handles basic types.
Pointer Arithmetic

• What is valid pointer arithmetic?
  – Add an integer to a pointer
  – Subtract 2 pointers (in the same array)
  – Compare pointers (<, <=, ==, !, >, >=)
  – Compare pointer to NULL (indicates that the pointer points to nothing)

• Everything else is illegal since it makes no sense:
  – Adding two pointers
  – Multiplying pointers
  – Subtract pointer from integer
Pointer Arithmetic to Copy Memory

• We can use pointer arithmetic to “walk” through memory:

```c
void copy(int *from, int *to, int n)
{
    int i;
    for (i=0; i<n; i++) {
        *to++ = *from++;
    }
}
```

• Note we had to pass size (n) to `copy`
int main(void) {
    int A[] = {5, 10};
    int *p = A;

    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
    p = p + 1;
    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
    *p = *p + 1;
    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
}

• If the first printf outputs 100 5 5 10, what will the next two printf output?
  a) 101 10 5 10 then 101 11 5 11
  b) 104 10 5 10 then 104 11 5 11
  c) 101 <other> 5 10 then 101 <3-others>
  d) 104 <other> 5 10 then 104 <3-others>
  e) One of the two printfs causes an ERROR
Peer Instruction

```c
int main(void) {
    int A[] = {5,10};
    int *p = A;

    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
    p = p + 1;
    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
    *p = *p + 1;
    printf("%u %d %d %d\n", p, *p, A[0], A[1]);
}
```

• If the first printf outputs 100 5 5 10, what will the next two printf output?
  a) 101 10 5 10  then 101 11 5 11
  b) 104 10 5 10  then 104 11 5 11
  c) 101 <other> 5 10  then 101 <3-others>
  d) 104 <other> 5 10  then 104 <3-others>
  e) One of the two printfs causes an ERROR
Pointer Arithmetic: Peer Instruction Question

How many of the following are invalid?

I. pointer + integer
II. integer + pointer
III. pointer + pointer
IV. pointer – integer
V. integer – pointer
VI. pointer – pointer
VII. compare pointer to pointer
VIII. compare pointer to integer
IX. compare pointer to 0
X. compare pointer to NULL

- Pointer Problems
- Summary
Agenda

• C and Pointer review
• Arrays
• Administrivia
• Pointer Arithmetic
• Break
• Pointer Misc
• Pointer Problems
• Summary
Pointers & Allocation (1/2)

• After declaring a pointer:
  – int *ptr;

• ptr doesn’t actually point to anything yet (points somewhere, but don’t know where). We can either:
  – Make it point to something that already exists, or
  – Allocate room in memory for something new that it will point to...
Pointers & Allocation (2/2)

• Option 1: Pointing to something that already exists:
  – int *ptr, var1, var2; var1 = 5;
    ptr = &var1; var2 = *ptr;
  – var1 and var2 have space implicitly allocated for them

• Option 2: Allocate room in memory for new thing to point to. See next lecture.
Arrays
(one element past array must be valid)

• Array size $n$; want to access from 0 to $n-1$, but test for exit by comparing to address one element past the array

```c
int ar[10], *p, *q, sum = 0;
...
p = &ar[0]; q = &ar[10];
while (p != q)
    /* sum = sum + *p; p = p + 1; */
    sum += *p++;
```

Is this legal?

• C defines that one element past end of array must be a valid address, i.e., will not cause an bus error or address error
Pointers and Functions (1/4)

• Sometimes you want to have a procedure increment a variable ...

• What gets printed?

```c
void AddOne(int x)
{
    x = x + 1;
}

int y = 5;
AddOne(y);
printf("y = %d\n", y);
```
Pointers and Functions (2/4)

• Solved by passing in a \textit{pointer} to our subroutine.

• Now what gets printed?

\begin{verbatim}
void AddOne(int *p)
{
    *p = *p + 1;
}

int y = 5;
AddOne(&y);
printf("y = %d\n", y);
\end{verbatim}

\begin{verbatim}
y = 6
\end{verbatim}
Pointers and Functions (3/4)

• But what if the thing you want changed is a pointer?
• What gets printed?

```c
void IncrementPtr(int *p)
{
    p = p + 1;
}

int A[3] = {50, 60, 70};
int *q = A;
IncrementPtr(q);
printf("*q = %d\n", *q);
```
Pointers and Functions (4/4)

• Solution! Pass a *pointer to a pointer*, declared as `**h`

• Now what gets printed?

```c
void IncrementPtr(int **h)
{
    *h = *h + 1;
}

int A[3] = {50, 60, 70};
int *q = A;
IncrementPtr(&q);
printf("*q = %d\n", *q);
```

```
A q q
50 60 70
```

$q = 60$
Agenda

- Arrays
- Administrivia
- Pointer Arithmetic
- Break
- Pointer Misc
- Pointer Problems
- Summary
Segmentation Fault vs. Bus Error

- **http://www.hyperdictionary.com/**
- **Bus Error**
  - A fatal failure in the execution of a machine language instruction resulting from the processor detecting an anomalous condition on its bus. Such conditions include invalid address alignment (accessing a multi-byte number at an odd address), accessing a physical address that does not correspond to any device, or some other device-specific hardware error. A bus error triggers a processor-level exception which Unix translates into a “SIGBUS” signal which, if not caught, will terminate the current process.

- **Segmentation Fault**
  - An error in which a running Unix program attempts to access memory not allocated to it and terminates with a segmentation violation error and usually a core dump.
C Pointer Dangers

• Unlike Java, C lets you cast a value of any type to any other type without performing any checking

\[
\text{int } x = 1000; \\
\text{int } *p = x; \quad /* \text{invalid} */ \\
\text{int } *q = (\text{int } *) x; \quad /* \text{valid} */
\]

• First pointer declaration is invalid since the types do not match

• Second declaration is valid C but is almost certainly wrong
  – Is it ever correct?
C String Problems

• Common mistake is to forget to allocate an extra byte for the null terminator
• More generally, C requires the programmer to manage memory manually (unlike Java or C++)
  – When creating a long string by concatenating several smaller strings, the programmer must insure there is enough space to store the full string!
  – What if you don’t know ahead of time how big your string will be?
  – Buffer overrun security holes!
More Common C Errors

• Difference between assignment and equality
  
  \[ a = b \] is assignment
  
  \[ a == b \] is an equality test

• One of the most common errors for beginning C programmers!
  
  – One pattern (when comparing with constant) is to put the var on the right!
  
  If you happen to use =, it won’t compile!

  • if (3 == a) {
    ...
  }

  6/22/2011
And in Conclusion, ...

- Pointers and array variables are very similar.
  - Can use pointer or array syntax to index into arrays.
- Strings are (null terminated) arrays of characters
- Adding 1 to a pointer moves the pointer by the size of the thing it’s pointing to.
- Pointers are the source of many bugs in C, so handle with care
