CS 61C: Great Ideas in Computer Architecture

Memory Management and Usage

Instructor: Justin Hsia
Review of Last Lecture

• Arrays
  – Traverse using pointer or array syntax
  – If characters, call them “strings” and null-terminate

• Pointer arithmetic moves the pointer by the size of the thing it’s pointing to
  – C accommodates for pointing to structs and pointers

• From Discussion: Bit-masking
Great Idea #1: Levels of Representation/Interpretation

Agenda

• C Memory Layout
  – Stack, Static Data, and Code
• Administrivia
• Dynamic Memory Allocation
  – Heap
• Common Memory Problems
• Memory Management
• C Wrap-up: Linked List Example
C Memory Layout

- Program’s *address space* contains 4 regions:
  - **Stack**: local variables, grows downward
  - **Heap**: space requested for pointers via `malloc()`; resizes dynamically, grows upward
  - **Static Data**: global and static variables, does not grow or shrink
  - **Code**: loaded when program starts, does not change

OS prevents accesses between stack and heap (via virtual memory)
Where Do the Variables Go?

• Declared outside a function:
  Static Data

• Declared inside a function:
  Stack
  – main() is a function
  – Freed when function returns

• Dynamically allocated:
  Heap
  – i.e. malloc (we will cover this shortly)

```c
#include <stdio.h>

int varGlobal;

int main() {
    int varLocal;
    int *varDyn = malloc(sizeof(int));
}
```
The Stack

- Each stack frame is a contiguous block of memory holding the local variables of a single procedure.
- A stack frame includes:
  - Location of caller function
  - Function arguments
  - Space for local variables
- Stack pointer (SP) tells where lowest (current) stack frame is.
- When procedure ends, stack frame is tossed off the stack; frees memory for future stack frames.
The Stack

- Last In, First Out (LIFO) data structure

```c
int main() {
    a(0);
    return 1;
}

void a(int m) {
    b(1);
}

void b(int n) {
    c(2);
    d(4);
}

void c(int o) {
    printf("c");
}

void d(int p) {
    printf("d");
}
```

Stack Pointer grows down

stack
Stack Misuse Example

```c
int *getPtr() {
    int y;
    y = 3;
    return &y;
}

int main () {
    int *stackAddr, content;
    stackAddr = getPtr();
    content = *stackAddr;
    printf("%d", content); /* 3 */
    content = *stackAddr;
    printf("%d", content); /* 0 */
}
```

**Never** return pointers to local variable from functions

Your compiler will warn you about this – don’t ignore such warnings!

printf
overwrites
stack frame
Static Data

• Place for variables that persist
  – Data not subject to comings and goings like function calls
    – Examples: String literals, global variables

• Size does not change, but its data can

Code

• Copy of your code goes here
  – C code becomes data too!

• Does not change
Question: Which statement below is FALSE? All statements assume each variable exists.

```c
void funcA() {int x; printf("A");}
void funcB() {
    int y;
    printf("B");
    funcA();
}
void main() {char *s = "s"; funcB();}
```

(A) x is at a lower address than y
(B) x and y are in adjacent frames
(C) x is at a lower address than *s
(D) y is in the 2nd frame from the top of the Stack
Agenda

• C Memory Layout
  – Stack, Static Data, and Code
• Administrivia
• Dynamic Memory Allocation
  – Heap
• Common Memory Problems
• Memory Management
• C Wrap-up: Linked List Example
Administrivia

• Meet your fellow classmates! Form study groups and get your questions answered
  – Utilize Piazza, labs, discussions, and OHs
• End of the first week!
  – HW1 due Sunday
  – TA and Instructor response time increase drastically (slower) over the weekend
  – Check key card access to lab today
• Suggestion for weekend:
  finish HW1, try Lab 3, then look at HW2
Agenda

• C Memory Layout
  – Stack, Static Data, and Code

• Administrivia

• Dynamic Memory Allocation
  – Heap

• Common Memory Problems

• Memory Management

• C Wrap-up: Linked List Example
Dynamic Memory Allocation

- Sometimes you don’t know how much memory you need beforehand
  - e.g. input files, user input
- Dynamically allocated memory goes on the Heap – more permanent than Stack
- Need as much space as possible without interfering with Stack
  - Start at opposite end and grow towards Stack
Allocating Memory

• 3 functions for requesting memory: 
  `malloc()`, `calloc()`, and `realloc()`
  

• `malloc(n)`
  
  – Allocates a continuous block of `n bytes` of uninitialized memory (contains garbage!)
  
  – Returns a pointer to the beginning of the allocated block; NULL indicates failed request (check for this!)
  
  – Different blocks not necessarily adjacent
Using malloc()

• Almost always used for arrays or structs
• Good practice to use `sizeof()` and typecasting
  
  ```c
  int *p = (int *) malloc(n*sizeof(int));
  ```
  
  – `sizeof()` makes code more portable
  
  – `malloc()` returns `void *`, typecast will help you catch coding errors when pointer types don’t match

• Can use array or pointer syntax to access
• Make sure you don’t lose the original address
  
  – `p++` is a BAD IDEA; use a separate pointer
Releasing Memory

• Release memory on the Heap using \texttt{free()}:
  – Memory is limited, release when done

• \texttt{free(p)}:
  – Pass it pointer \texttt{p} to beginning of allocated block; releases the whole block
  – \texttt{p} must be the address \textit{originally} returned by \texttt{m/c/realloc()}, otherwise throws system exception
  – Don’t call \texttt{free()} on a block that has already been released or on NULL
Dynamic Memory Example

- Need `#include <stdlib.h>`

```c
typedef struct {
    int x;
    int y;
} point;

point *rect; /* opposite corners = rectangle */
...
if( !(rect=(point *) malloc(2*sizeof(point))) ) {  
    printf("\nOut of memory!\n");
    exit(1);
}
...
Do NOT change rect during this time!!!
free(rect);
```

Check for returned NULL
Question: Want output: `a[] = {0,1,2}` with no errors. Which lines do we need to change?

```c
#define N 3
int *makeArray(int n) {
    int *ar;
    ar = (int *) malloc(n);
    return ar;
}
void main() {
    int i,*a = makeArray(N);
    for(i=0; i<N; i++)
        *a++ = i;
    printf("a[] = {%i,%i,%i}",a[0],a[1],a[2]);
    free(a);
}
```

(B) 5, 12  
(C) 4, 10  
(D) 5, 10
Agenda

• C Memory Layout
  – Stack, Static Data, and Code

• Administrivia

• Dynamic Memory Allocation
  – Heap

• Common Memory Problems

• Memory Management

• C Wrap-up: Linked List Example
Know Your Memory Errors
(Definitions taken from http://www.hyperdictionary.com)

• Segmentation Fault ← More common in 61C
  “An error in which a running Unix program attempts to access memory not allocated to it and terminates with a segmentation violation error and usually a core dump.”

• Bus Error ← Less common in 61C
  “A fatal failure in the execution of a machine language instruction resulting from the processor detecting an anomalous condition on its bus. Such conditions include invalid address alignment (accessing a multi-byte number at an odd address), accessing a physical address that does not correspond to any device, or some other device-specific hardware error.”
Common Memory Problems

1) Using uninitialized values
2) Using memory that you don’t own
   – Using NULL or garbage data as a pointer
   – De-allocated stack or heap variable
   – Out of bounds reference to stack or heap array
3) Using memory you haven’t allocated
4) Freeing invalid memory
5) Memory leaks
Using Uninitialized Values

• What is wrong with this code?

```c
void foo(int *p) {
    int j;
    *p = j;
}
```

```c
void bar() {
    int i=10;
    foo(&i);
    printf("i = %d\n", i);
}
```

- `j` is uninitialized (garbage), copied into `*p`
- Using `i` which now contains garbage
Using Memory You Don’t Own (1)

• What is wrong with this code?

```c
typedef struct node {
    struct node* next;
    int val;
} Node;

int findLastNodeValue(Node* head) {
    while (head->next != NULL)
        head = head->next;
    return head->val;
}
```

What if `head` is NULL?

No warnings! Just Seg Fault that needs finding!
Using Memory You Don’t Own (2)

• What’s wrong with this code?

```c
char *append(const char* s1, const char *s2) {
    const int MAXSIZE = 128;
    char result[MAXSIZE];
    int i=0, j=0;
    for (j=0; i<MAXSIZE-1 && j<strlen(s1); i++,j++)
        result[i] = s1[j];
    for (j=0; i<MAXSIZE-1 && j<strlen(s2); i++,j++)
        result[i] = s2[j];
    result[++i] = '\0';
    return result;
}
```

Local array appears on Stack

Pointer to Stack (array) no longer valid once function returns
Using Memory You Don’t Own (3)

• What is wrong with this code?

typedef struct {
    char *name;
    int age;
} Profile;

Profile *person = (Profile *)malloc(sizeof(Profile));
char *name = getName();
person.name = malloc(sizeof(char)*strlen(name));
strcpy(person.name, name);
... // Do stuff (that isn’t buggy)
free(person);
free(person.name);

Did not allocate space for the null terminator!
Want (strlen(name)+1) here.

Accessing memory after you’ve freed it.
These statements should be switched.
Using Memory You Haven’t Allocated

• What is wrong with this code?

```c
void StringManipulate() {
    const char *name = "Safety Critical";
    char *str = malloc(10);
    strncpy(str, name, 10);
    str[10] = '\0';  // Write beyond array bounds
    printf("%s\n", str);  // Read beyond array bounds
}
```
Using Memory You Haven’t Allocated

• What is wrong with this code?

```c
char buffer[1024]; /* global */
int main(int argc, char *argv[]) {
    strcpy(buffer, argv[1]);
    ...
}
```

What if more than a kibi characters?

This is called BUFFER OVERRUN or BUFFER OVERFLOW and is a security flaw!!!
Freeing Invalid Memory

• What is wrong with this code?

```c
void FreeMemX() {
    int fnh = 0;
    free(&fnh);  // 1) Free of a Stack variable
}

void FreeMemY() {
    int *fum = malloc(4*sizeof(int));
    free(fum+1);  // 2) Free of middle of block
    free(fum);
    free(fum);  // 3) Free of already freed block
}
```
Memory Leaks

• What is wrong with this code?

```c
int *pi;

void foo() {
    pi = (int*)malloc(8*sizeof(int));
    ...
    free(pi);
}

void main() {
    pi = (int*)malloc(4*sizeof(int));
    foo();
}
```

Overrode old pointer!

No way to free those 4*sizeof(int) bytes now

foo() leaks memory
Memory Leaks

• **Rule of Thumb:** More `mallocs` than `frees` probably indicates a memory leak

• Potential memory leak: Changing pointer – do you still have copy to use with `free` later?

```c
plk = (int *)malloc(2*sizeof(int));
...
plk++; // Typically happens through incrementation or reassignment
```
Debugging Tools

• Runtime analysis tools for finding memory errors
  – Dynamic analysis tool: Collects information on memory management while program runs
  – No tool is guaranteed to find ALL memory bugs; this is a very challenging programming language research problem

• You will be introduced to Valgrind in Lab 3

http://valgrind.org
Get To Know Your Instructor
Agenda

• C Memory Layout
  – Stack, Static Data, and Code
• Administrivia
• Dynamic Memory Allocation
  – Heap
• Common Memory Problems
• Memory Management
• C Wrap-up: Linked List Example
Memory Management

• Many calls to `malloc()` and `free()` with many different size blocks – where are they placed?

• Want system to be fast with minimal memory overhead
  – Versus automatic garbage collection of Java

• Want to avoid fragmentation, the tendency of free space on the heap to get separated into small chunks
1) Block 1: malloc(100)
2) Block 2: malloc(1)
3) Block 1: free(B1)
4) Block 3: malloc(50)
   – What if malloc(101)?
5) Block 4: malloc(60)
Basic Allocation Strategy: K&R

• Section 8.7 offers an implementation of memory management (linked list of free blocks)
  – If you can decipher the code, you’re well-versed in C!
• This is just one of many possible memory management algorithms
  – Just to give you a taste
  – No single best approach for every application
K&R Implementation

• Each block holds its own size and pointer to next block
• `free()` adds block to the list, combines with adjacent free blocks
• `malloc()` searches free list for block large enough to meet request
  – If multiple blocks fit request, which one do we use?
Choosing a Block in malloc()

• **Best-fit:** Choose smallest block that fits request
  – Tries to limit wasted fragmentation space, but takes more time and leaves lots of small blocks

• **First-fit:** Choose first block that is large enough (always starts from beginning)
  – Fast but tends to concentrate small blocks at beginning

• **Next-fit:** Like first-fit, but resume search from where we last left off
  – Fast and does not concentrate small blocks at front
Question: Which allocation system and set of requests will create a continuous block in the Heap? B3 was the last fulfilled request.

(A) **Best-fit:**
\[\text{malloc}(50), \text{malloc}(50)\]

(B) **First-fit:**
\[\text{malloc}(50), \text{malloc}(30)\]

(C) **Next-fit:**
\[\text{malloc}(30), \text{malloc}(50)\]

(D) **Next-fit:**
\[\text{malloc}(50), \text{malloc}(30)\]
Agenda

• C Memory Layout
  – Stack, Static Data, and Code
• Administrivia
• Dynamic Memory Allocation
  – Heap
• Common Memory Problems
• Memory Management
• C Wrap-up: Linked List Example
Linked List Example

• We want to generate a linked list of strings
  – This example uses structs, pointers, malloc(), and free()

• Create a structure for nodes of the list:

  ```c
  struct Node {
    char *value;
    struct Node *next;
  };
  ```

The link of the linked list
Simplify Code with `typedef`

- It gets annoying to type out `struct ListNode` over and over again
  
  - Define new variable type for struct:

    ```c
    Method 1:
    struct Node {
        char *value;
        struct Node *next;
    };
    typedef struct Node ListNode;
    ```

    ```c
    Method 2:
    typedef struct Node {
        char *value;
        struct Node *next;
    } ListNode;
    ```

- Can further rename pointers:

  ```c
typedef ListNode * List;  // List myLinkedList;
typedef char * String;    // String value;
```
Adding a Node to the List

• Want functionality as shown:

```java
String s1 = "start", s2 = "middle";
String s3 = "end";
List theList = NULL;
theList = addNode(s3, theList);
theList = addNode(s2, theList);
theList = addNode(s1, theList);
```

In what part of memory are these stored?

Must be able to handle a NULL input

If you’re more familiar with Lisp/Scheme, you could name this function `cons` instead.
Adding a Node to the List

Let’s examine the 3rd call ("start"): 

```c
List addNode(String s, List list) {
    List node = (List) malloc(sizeof(NodeStruct));
    node->value = (String) malloc(strlen(s) + 1);
    strcpy(node->value, s);
    node->next = list;
    return node;
}
```

Don’t forget this for the null terminator!

6/27/2013 Summer 2013 – Lecture #4
Removing a Node from the List

• **Delete/free the first node ("start"):**

```c
List deleteNode(List list) {
    List temp = list->next;
    free(list->value);
    free(list);
    return temp;
}
```

What happens if you do these in the wrong order?
Additional Functionality

• How might you implement the following:
  – Append node to end of a list
  – Delete/free an entire list
  – Join two lists together
  – Reorder a list alphabetically (sort)
Summary

• C Memory Layout
  – **Static Data:** globals and string literals
  – **Code:** copy of machine code
  – **Stack:** local variables (grows & shrinks in LIFO manner)
  – **Heap:** dynamic storage using `malloc` and `free`

The source of most memory bugs!

• Memory Management
  – Want fast with little *fragmentation*
