

## CS70: Lecture 20.

### Distributions; Independent RVs

1. Review: Expectation
2. Distributions
3. Independent RVs

## Geometric Distribution

Let's flip a coin with  $\Pr[H] = p$  until we get  $H$ .

For instance:

$\omega_1 = H$ , or  
 $\omega_2 = T H$ , or  
 $\omega_3 = T T H$ , or  
 $\omega_n = T T T T \dots T H$ .

Note that  $\Omega = \{\omega_n, n = 1, 2, \dots\}$ .

Let  $X$  be the number of flips until the first  $H$ . Then,  $X(\omega_n) = n$ .

Also,

$$\Pr[X = n] = (1 - p)^{n-1} p, \quad n \geq 1.$$

## Review: Expectation

- ▶  $E[X] := \sum_x x \Pr[X = x] = \sum_{\omega} X(\omega) \Pr[\omega]$ .
- ▶  $E[g(X, Y)] = \sum_{x,y} g(x,y) \Pr[X = x, Y = y]$   
 $= \sum_{\omega} g(X(\omega), Y(\omega)) \Pr[\omega]$
- ▶  $E[aX + bY + c] = aE[X] + bE[Y] + c$ .

## Geometric Distribution

$$\Pr[X = n] = (1 - p)^{n-1} p, \quad n \geq 1.$$

## Uniform Distribution

Roll a six-sided balanced die. Let  $X$  be the number of pips (dots). Then  $X$  is equally likely to take any of the values  $\{1, 2, \dots, 6\}$ . We say that  $X$  is *uniformly distributed* in  $\{1, 2, \dots, 6\}$ .

More generally, we say that  $X$  is uniformly distributed in  $\{1, 2, \dots, n\}$  if  $\Pr[X = m] = 1/n$  for  $m = 1, 2, \dots, n$ . In that case,

$$E[X] = \sum_{m=1}^n m \Pr[X = m] = \sum_{m=1}^n m \times \frac{1}{n} = \frac{1}{n} \frac{n(n+1)}{2} = \frac{n+1}{2}.$$

## Geometric Distribution

$$\Pr[X = n] = (1 - p)^{n-1} p, \quad n \geq 1.$$

Note that

$$\sum_{n=1}^{\infty} \Pr[X_n] = \sum_{n=1}^{\infty} (1 - p)^{n-1} p = p \sum_{n=1}^{\infty} (1 - p)^{n-1} = p \sum_{n=0}^{\infty} (1 - p)^n.$$

Now, if  $|a| < 1$ , then  $S := \sum_{n=0}^{\infty} a^n = \frac{1}{1-a}$ . Indeed,

$$\begin{aligned}
 S &= 1 + a + a^2 + a^3 + \dots \\
 aS &= a + a^2 + a^3 + a^4 + \dots \\
 (1-a)S &= 1 + a - a - a^2 + a^2 - a^2 + \dots = 1.
 \end{aligned}$$

Hence,

$$\sum_{n=1}^{\infty} \Pr[X_n] = p \frac{1}{1 - (1-p)} = 1.$$

## Geometric Distribution: Expectation

$$X =_D G(p), \text{ i.e., } Pr[X = n] = (1-p)^{n-1}p, n \geq 1.$$

One has

$$E[X] = \sum_{n=1}^{\infty} nPr[X = n] = \sum_{n=1}^{\infty} n(1-p)^{n-1}p.$$

Thus,

$$\begin{aligned} E[X] &= p + 2(1-p)p + 3(1-p)^2p + 4(1-p)^3p + \dots \\ (1-p)E[X] &= (1-p)p + 2(1-p)^2p + 3(1-p)^3p + \dots \\ pE[X] &= p + (1-p)p + (1-p)^2p + (1-p)^3p + \dots \\ &\text{by subtracting the previous two identities} \\ &= \sum_{n=1}^{\infty} Pr[X = n] = 1. \end{aligned}$$

Hence,

$$E[X] = \frac{1}{p}.$$

## Review: Harmonic sum

$$H(n) = 1 + \frac{1}{2} + \dots + \frac{1}{n} \approx \int_1^n \frac{1}{x} dx = \ln(n).$$

A good approximation is

$$H(n) \approx \ln(n) + \gamma \text{ where } \gamma \approx 0.58 \text{ (Euler-Mascheroni constant).}$$

## Coupon Collectors Problem.

**Experiment:** Get coupons at random from  $n$  until collect all  $n$  coupons.

**Outcomes:** {123145..., 56765...}

**Random Variable:**  $X$  - length of outcome.

Before:  $Pr[X \geq n \ln 2n] \leq \frac{1}{2}$ .

Today:  $E[X]$ ?

## Time to collect coupons

$X$ -time to get  $n$  coupons.

$X_1$  - time to get first coupon. Note:  $X_1 = 1$ .  $E(X_1) = 1$ .

$X_2$  - time to get second coupon after getting first.

$Pr$ ["get second coupon"|"got milk first coupon"] =  $\frac{n-1}{n}$

$E[X_2]$ ? **Geometric !!!**  $\implies E[X_2] = \frac{1}{\frac{n-1}{n}} = \frac{n}{n-1}$ .

$Pr$ ["getting  $i$ th coupon"|"got  $i-1$ st coupons"] =  $\frac{n-(i-1)}{n} = \frac{n-i+1}{n}$

$E[X_i] = \frac{1}{\frac{n-i+1}{n}}, i = 1, 2, \dots, n$ .

$$\begin{aligned} E[X] &= E[X_1] + \dots + E[X_n] = \frac{n}{n} + \frac{n}{n-1} + \frac{n}{n-2} + \dots + \frac{n}{1} \\ &= n \left( 1 + \frac{1}{2} + \dots + \frac{1}{n} \right) = nH(n) \approx n(\ln n + \gamma) \end{aligned}$$

## Harmonic sum: Paradox

Consider this stack of cards (no glue!):

If each card has length 2, the stack can extend  $H(n)$  to the right of the table. As  $n$  increases, you can go as far as you want!

## Paradox

### par·a·dox

/ˈpɛrəˌdɒks/

*noun*

a statement or proposition that, despite sound (or apparently sound) reasoning from acceptable premises, leads to a conclusion that seems senseless, logically unacceptable, or self-contradictory.

"a potentially serious conflict between quantum mechanics and the general theory of relativity known as the information paradox"

- a seemingly absurd or self-contradictory statement or proposition that when investigated or explained may prove to be well founded or true.

"in a paradox, he has discovered that stepping back from his job has increased the rewards he gleans from it"

*synonyms:* contradiction, contradiction in terms, self-contradiction, inconsistency, incongruity; **More**

- a situation, person, or thing that combines contradictory features or qualities. "the mingling of deciduous trees with elements of desert flora forms a fascinating ecological paradox"

## Stacking

The cards have width 2. Induction shows that the center of gravity after  $n$  cards is  $H(n)$  away from the right-most edge.

## Geometric Distribution: Yet another look

**Theorem:** For a r.v.  $X$  that takes the values  $\{0, 1, 2, \dots\}$ , one has

$$E[X] = \sum_{i=1}^{\infty} Pr[X \geq i].$$

[See later for a proof.]

If  $X = G(p)$ , then  $Pr[X \geq i] = Pr[X > i-1] = (1-p)^{i-1}$ .

Hence,

$$E[X] = \sum_{i=1}^{\infty} (1-p)^{i-1} = \sum_{i=0}^{\infty} (1-p)^i = \frac{1}{1-(1-p)} = \frac{1}{p}.$$

## Geometric Distribution: Memoryless

Let  $X$  be  $G(p)$ . Then, for  $n \geq 0$ ,

$$Pr[X > n] = Pr[\text{first } n \text{ flips are } T] = (1-p)^n.$$

**Theorem**

$$Pr[X > n+m | X > n] = Pr[X > m], m, n \geq 0.$$

**Proof:**

$$\begin{aligned} Pr[X > n+m | X > n] &= \frac{Pr[X > n+m \text{ and } X > n]}{Pr[X > n]} \\ &= \frac{Pr[X > n+m]}{Pr[X > n]} \\ &= \frac{(1-p)^{n+m}}{(1-p)^n} = (1-p)^m \\ &= Pr[X > m]. \end{aligned}$$

## Geometric Distribution: Memoryless - Interpretation

$$Pr[X > n+m | X > n] = Pr[X > m], m, n \geq 0.$$

$$Pr[X > n+m | X > n] = Pr[A|B] = Pr[A] = Pr[X > m].$$

The coin is memoryless, therefore, so is  $X$ .

## Expected Value of Integer RV

**Theorem:** For a r.v.  $X$  that takes values in  $\{0, 1, 2, \dots\}$ , one has

$$E[X] = \sum_{i=1}^{\infty} Pr[X \geq i].$$

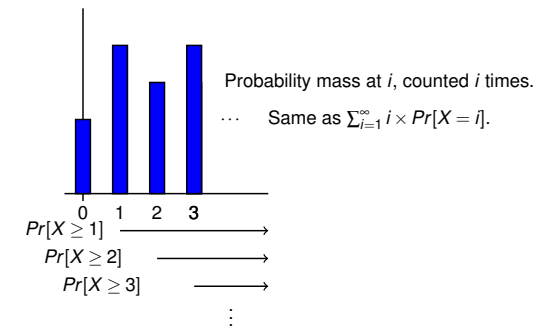

**Proof:** One has

$$\begin{aligned} E[X] &= \sum_{i=1}^{\infty} i \times Pr[X = i] \\ &= \sum_{i=1}^{\infty} i \{ Pr[X \geq i] - Pr[X \geq i+1] \} \\ &= \sum_{i=1}^{\infty} \{ i \times Pr[X \geq i] - i \times Pr[X \geq i+1] \} \\ &= \sum_{i=1}^{\infty} \{ i \times Pr[X \geq i] - (i-1) \times Pr[X \geq i] \} \\ &= \sum_{i=1}^{\infty} Pr[X \geq i]. \end{aligned}$$

□

**Theorem:** For a r.v.  $X$  that takes values in  $\{0, 1, 2, \dots\}$ , one has

$$E[X] = \sum_{i=1}^{\infty} Pr[X \geq i].$$

## Poisson

Experiment: flip a coin  $n$  times. The coin is such that  $Pr[H] = \lambda/n$ .  
Random Variable:  $X$  - number of heads. Thus,  $X = B(n, \lambda/n)$ .

**Poisson Distribution** is distribution of  $X$  "for large  $n$ ."

## Poisson

Experiment: flip a coin  $n$  times. The coin is such that  $Pr[H] = \lambda/n$ .  
Random Variable:  $X$  - number of heads. Thus,  $X = B(n, \lambda/n)$ .

**Poisson Distribution** is distribution of  $X$  "for large  $n$ ."

We expect  $X \ll n$ . For  $m \ll n$  one has

$$\begin{aligned} Pr[X = m] &= \binom{n}{m} p^m (1-p)^{n-m}, \text{ with } p = \lambda/n \\ &= \frac{n(n-1)\cdots(n-m+1)}{m!} \left(\frac{\lambda}{n}\right)^m \left(1 - \frac{\lambda}{n}\right)^{n-m} \\ &= \frac{n(n-1)\cdots(n-m+1)}{n^m} \frac{\lambda^m}{m!} \left(1 - \frac{\lambda}{n}\right)^{n-m} \\ &\approx^{(1)} \frac{\lambda^m}{m!} \left(1 - \frac{\lambda}{n}\right)^{n-m} \approx^{(2)} \frac{\lambda^m}{m!} \left(1 - \frac{\lambda}{n}\right)^n \approx \frac{\lambda^m}{m!} e^{-\lambda}. \end{aligned}$$

For (1) we used  $m \ll n$ ; for (2) we used  $(1 - a/n)^n \approx e^{-a}$ .

## Poisson Distribution: Definition and Mean

**Definition** Poisson Distribution with parameter  $\lambda > 0$

$$X = P(\lambda) \Leftrightarrow Pr[X = m] = \frac{\lambda^m}{m!} e^{-\lambda}, m \geq 0.$$

**Fact:**  $E[X] = \lambda$ .

**Proof:**

$$\begin{aligned} E[X] &= \sum_{m=1}^{\infty} m \times \frac{\lambda^m}{m!} e^{-\lambda} = e^{-\lambda} \sum_{m=1}^{\infty} \frac{\lambda^m}{(m-1)!} \\ &= e^{-\lambda} \sum_{m=0}^{\infty} \frac{\lambda^{m+1}}{m!} = e^{-\lambda} \lambda \sum_{m=0}^{\infty} \frac{\lambda^m}{m!} \\ &= e^{-\lambda} \lambda e^{\lambda} = \lambda. \end{aligned}$$

□

## Simeon Poisson

The Poisson distribution is named after:

## Equal Time: B. Geometric

The geometric distribution is named after:

Prof. Walrand could not find a picture of D. Binomial, sorry.

## Review: Distributions

- ▶  $U[1, \dots, n] : Pr[X = m] = \frac{1}{n}, m = 1, \dots, n;$   
 $E[X] = \frac{n+1}{2};$
- ▶  $B(n, p) : Pr[X = m] = \binom{n}{m} p^m (1-p)^{n-m}, m = 0, \dots, n;$   
 $E[X] = np;$
- ▶  $G(p) : Pr[X = n] = (1-p)^{n-1} p, n = 1, 2, \dots;$   
 $E[X] = \frac{1}{p};$
- ▶  $P(\lambda) : Pr[X = n] = \frac{\lambda^n}{n!} e^{-\lambda}, n \geq 0;$   
 $E[X] = \lambda.$

## Independent Random Variables.

### Definition: Independence

The random variables  $X$  and  $Y$  are **independent** if and only if

$$Pr\{Y = b | X = a\} = Pr\{Y = b\}, \text{ for all } a \text{ and } b.$$

### Fact:

$X, Y$  are independent if and only if

$$Pr\{X = a, Y = b\} = Pr\{X = a\}Pr\{Y = b\}, \text{ for all } a \text{ and } b.$$

Obvious. □

## Functions of Independent random Variables

**Theorem** Functions of independent RVs are independent  
Let  $X, Y$  be independent RV. Then

$f(X)$  and  $g(Y)$  are independent, for all  $f(\cdot), g(\cdot)$ .

### Proof:

Recall the definition of inverse image:

$$h(z) \in C \Leftrightarrow z \in h^{-1}(C) := \{z \mid h(z) \in C\}. \quad (1)$$

Now,

$$\begin{aligned} Pr\{f(X) \in A, g(Y) \in B\} &= Pr\{X \in f^{-1}(A), Y \in g^{-1}(B)\}, \text{ by (1)} \\ &= Pr\{X \in f^{-1}(A)\}Pr\{Y \in g^{-1}(B)\}, \text{ since } X, Y \text{ ind.} \\ &= Pr\{f(X) \in A\}Pr\{g(Y) \in B\}, \text{ by (1)}. \end{aligned}$$

□

## Independence: Examples

### Example 1

Roll two die.  $X, Y$  = number of pips on the two dice.  $X, Y$  are independent.

Indeed:  $Pr\{X = a, Y = b\} = \frac{1}{36}, Pr\{X = a\} = Pr\{Y = b\} = \frac{1}{6}$ .

### Example 2

Roll two die.  $X$  = total number of pips,  $Y$  = number of pips on die 1 minus number on die 2.  $X$  and  $Y$  are not independent.

Indeed:  $Pr\{X = 12, Y = 1\} = 0 \neq Pr\{X = 12\}Pr\{Y = 1\} > 0$ .

### Example 3

Flip a fair coin five times,  $X$  = number of  $H$ s in first three flips,  $Y$  = number of  $H$ s in last two flips.  $X$  and  $Y$  are independent.

Indeed:

$$Pr\{X = a, Y = b\} = \binom{3}{a} \binom{2}{b} 2^{-5} = \binom{3}{a} 2^{-3} \times \binom{2}{b} 2^{-2} = Pr\{X = a\}Pr\{Y = b\}.$$

## Mean of product of independent RV

### Theorem

Let  $X, Y$  be independent RVs. Then

$$E[XY] = E[X]E[Y].$$

### Proof:

Recall that  $E[g(X, Y)] = \sum_{x,y} g(x, y)Pr\{X = x, Y = y\}$ . Hence,

$$\begin{aligned} E[XY] &= \sum_{x,y} xyPr\{X = x, Y = y\} = \sum_{x,y} xyPr\{X = x\}Pr\{Y = y\}, \text{ by ind.} \\ &= \sum_x \left[ \sum_y xyPr\{X = x\}Pr\{Y = y\} \right] = \sum_x [xPr\{X = x\} \left( \sum_y yPr\{Y = y\} \right)] \\ &= \sum_x [xPr\{X = x\}E[Y]] = E[X]E[Y]. \end{aligned}$$

□

## A useful observation about independence

### Theorem

$X$  and  $Y$  are independent if and only if

$$Pr\{X \in A, Y \in B\} = Pr\{X \in A\}Pr\{Y \in B\} \text{ for all } A, B \subset \mathfrak{R}.$$

### Proof:

If ( $\Rightarrow$ ): Choose  $A = \{a\}$  and  $B = \{b\}$ .

This shows that  $Pr\{X = a, Y = b\} = Pr\{X = a\}Pr\{Y = b\}$ .

Only if ( $\Rightarrow$ ):

$$\begin{aligned} Pr\{X \in A, Y \in B\} &= \sum_{a \in A} \sum_{b \in B} Pr\{X = a, Y = b\} = \sum_{a \in A} \sum_{b \in B} Pr\{X = a\}Pr\{Y = b\} \\ &= \sum_{a \in A} \left[ \sum_{b \in B} Pr\{X = a\}Pr\{Y = b\} \right] = \sum_{a \in A} Pr\{X = a\} \left[ \sum_{b \in B} Pr\{Y = b\} \right] \\ &= \sum_{a \in A} Pr\{X = a\}Pr\{Y \in B\} = Pr\{X \in A\}Pr\{Y \in B\}. \end{aligned}$$

□

## Examples

(1) Assume that  $X, Y, Z$  are (pairwise) independent, with  $E[X] = E[Y] = E[Z] = 0$  and  $E[X^2] = E[Y^2] = E[Z^2] = 1$ .

Then

$$\begin{aligned} E[(X + 2Y + 3Z)^2] &= E[X^2 + 4Y^2 + 9Z^2 + 4XY + 12YZ + 6XZ] \\ &= 1 + 4 + 9 + 4 \times 0 + 12 \times 0 + 6 \times 0 \\ &= 14. \end{aligned}$$

(2) Let  $X, Y$  be independent and  $U[1, 2, \dots, n]$ . Then

$$\begin{aligned} E[(X - Y)^2] &= E[X^2 + Y^2 - 2XY] = 2E[X^2] - 2E[X]E[Y] \\ &= \frac{1 + 3n + 2n^2}{3} - \frac{(n+1)^2}{2}. \end{aligned}$$

## Mutually Independent Random Variables

### Definition

$X, Y, Z$  are mutually independent if

$$Pr[X = x, Y = y, Z = z] = Pr[X = x]Pr[Y = y]Pr[Z = z], \text{ for all } x, y, z.$$

### Theorem

The events  $A, B, C, \dots$  are pairwise (resp. mutually) independent if the random variables  $1_A, 1_B, 1_C, \dots$  are pairwise (resp. mutually) independent.

### Proof:

$$Pr[1_A = 1, 1_B = 1, 1_C = 1] = Pr[A \cap B \cap C], \dots$$

□

## Operations on Mutually Independent Events

### Theorem

Operations on disjoint collections of mutually independent events produce mutually independent events.

For instance, if  $A, B, C, D, E$  are mutually independent, then  $A \Delta B, C \setminus D, \bar{E}$  are mutually independent.

### Proof:

$$1_{A \Delta B} = f(1_A, 1_B) \text{ where } f(0,0) = 0, f(1,0) = 1, f(0,1) = 1, f(1,1) = 0$$

$$1_{C \setminus D} = g(1_C, 1_D) \text{ where } g(0,0) = 0, g(1,0) = 1, g(0,1) = 0, g(1,1) = 0$$

$$1_{\bar{E}} = h(1_E) \text{ where } h(0) = 1 \text{ and } h(1) = 0.$$

Hence,  $1_{A \Delta B}, 1_{C \setminus D}, 1_{\bar{E}}$  are functions of mutually independent RVs. Thus, those RVs are mutually independent. Consequently, the events of which they are indicators are mutually independent. □

## Functions of pairwise independent RVs

If  $X, Y, Z$  are pairwise independent, but not mutually independent, it may be that

$f(X)$  and  $g(Y, Z)$  are not independent.

**Example 1:** Flip two fair coins,  $X = 1\{\text{coin 1 is } H\}, Y = 1\{\text{coin 2 is } H\}, Z = X \oplus Y$ . Then,  $X, Y, Z$  are pairwise independent. Let  $g(Y, Z) = Y \oplus Z$ . Then  $g(Y, Z) = X$  is not independent of  $X$ .

**Example 2:** Let  $A, B, C$  be pairwise but not mutually independent in a way that  $A$  and  $B \cap C$  are not independent. Let  $X = 1_A, Y = 1_B, Z = 1_C$ . Choose  $f(X) = X, g(Y, Z) = YZ$ .

## Product of mutually independent RVs

### Theorem

Let  $X_1, \dots, X_n$  be mutually independent RVs. Then,

$$E[X_1 X_2 \cdots X_n] = E[X_1]E[X_2] \cdots E[X_n].$$

### Proof:

Assume that the result is true for  $n$ . (It is true for  $n = 2$ .)

Then, with  $Y = X_1 \cdots X_n$ , one has

$$\begin{aligned} E[X_1 \cdots X_n X_{n+1}] &= E[Y X_{n+1}], \\ &= E[Y]E[X_{n+1}], \\ &\quad \text{because } Y, X_{n+1} \text{ are independent} \\ &= E[X_1] \cdots E[X_n]E[X_{n+1}]. \end{aligned}$$

□

## Functions of mutually independent RVs

One has the following result:

### Theorem

Functions of disjoint collections of mutually independent random variables are mutually independent.

### Example:

Let  $\{X_n, n \geq 1\}$  be mutually independent. Then,

$Y_1 := X_1 X_2 (X_3 + X_4)^2, Y_2 := \max\{X_5, X_6\} - \min\{X_7, X_8\}, Y_3 := X_9 \cos(X_{10} + X_{11})$  are mutually independent.

### Proof:

Let  $B_1 := \{(X_1, X_2, X_3, X_4) \mid X_1 X_2 (X_3 + X_4)^2 \in A_1\}$ . Similarly for  $B_2, B_3$ . Then

$$\begin{aligned} Pr[Y_1 \in A_1, Y_2 \in A_2, Y_3 \in A_3] \\ &= Pr[(X_1, \dots, X_4) \in B_1, (X_5, \dots, X_8) \in B_2, (X_9, \dots, X_{11}) \in B_3] \\ &= Pr[(X_1, \dots, X_4) \in B_1]Pr[(X_5, \dots, X_8) \in B_2]Pr[(X_9, \dots, X_{11}) \in B_3] \\ &= Pr[Y_1 \in A_1]Pr[Y_2 \in A_2]Pr[Y_3 \in A_3] \end{aligned}$$

□

## Summary.

Distributions; Independence

Distributions:

- ▶  $G(p) : E[X] = 1/p;$
- ▶  $B(n, p) : E[X] = np;$
- ▶  $P(\lambda) : E[X] = \lambda$

Independence:

- ▶  $X, Y$  independent  $\Leftrightarrow Pr[X \in A, Y \in B] = Pr[X \in A]Pr[Y \in B]$
- ▶ Then,  $f(X), g(Y)$  are independent and  $E[XY] = E[X]E[Y]$
- ▶ Mutual independence ....
