## EE 140/240A Linear Integrated Circuits <br> Fall 2019

## This homework is due September 25, 2019, at 23:00.

## Submission Format

Your homework submission should consist of one file.

- hw 4.pdf: A single PDF file that contains all of your answers (any handwritten answers should be scanned).

Submit each file to its respective assignment on bCourses.

1. Single-Pole Amplifier (Spring 2015 Midterm 1 Q1)

Fill in the following table where each row is a different single-pole amplifier.

| $G_{m}$ <br> $(\mathrm{~S})$ | $R_{o}$ <br> $(\Omega)$ | $C_{L}$ <br> $(\mathrm{~F})$ | $\left\|A_{v 0}\right\|$ <br> $(\mathrm{V} / \mathrm{V})$ | $\omega_{p}$ <br> $(\mathrm{rad} / \mathrm{s})$ | $\omega_{u}$ <br> $(\mathrm{rad} / \mathrm{s})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 10 m |  |  | 10 |  | 100 G |
| $1 \mu$ | 1 M | 10 f |  |  |  |
|  |  | 1 p | 100 | 10 M |  |

Solution: Once again for the single-pole amplifier, we have the following equations:

$$
\begin{aligned}
A_{\nu 0} & =-G_{m} R_{o} \\
\omega_{p} & =\frac{1}{R_{o} C_{L}} \\
\omega_{u} & =\left|A_{\nu 0}\right| \omega_{p}=\frac{G_{m}}{C_{L}}
\end{aligned}
$$

| $G_{m}$ <br> $(\mathrm{~S})$ | $R_{o}$ <br> $(\Omega)$ | $C_{L}$ <br> $(\mathrm{~F})$ | $\left\|A_{\nu 0}\right\|$ <br> $(\mathrm{V} / \mathrm{V})$ | $\omega_{p}$ <br> $(\mathrm{rad} / \mathrm{s})$ | $\omega_{u}$ <br> $(\mathrm{rad} / \mathrm{s})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 10 m | $\mathbf{1 k}$ | $\mathbf{1 0 0 f}$ | 10 | $\mathbf{1 0 G}$ | 100 G |
| $1 \mu$ | 1 M | 10 f | $\mathbf{1}$ | $\mathbf{1 0 0 M}$ | $\mathbf{0}$ to 100M |
| $\mathbf{1 m}$ | $\mathbf{1 0 0 k}$ | 1 p | 100 | 10 M | $\mathbf{1 G}$ |

Rubric: (18 Points)

- +2 : Correct numerical answer. $(9 \times)$

## 2. New Transistor, Who Dis (Spring 2015 Midterm 1 Q3b)

You invent a new transistor and find the output current is given by

$$
\begin{aligned}
I_{x y} & =K V_{z y}^{3} V_{x y}^{\frac{1}{2}} \\
I_{z} & =0
\end{aligned}
$$

(a) What are the formulas for transconductance and output resistance?

Solution: In this, our input is at $Z$ and our output is at $X$.

$$
\begin{aligned}
g_{m} & =\frac{\partial I_{x y}}{\partial V_{z y}} \\
& =3 K V_{z y}^{2} V_{x y}^{\frac{1}{2}}
\end{aligned}
$$

$$
r_{o}=\left(\frac{\partial I_{x y}}{\partial V_{x y}}\right)^{-1}
$$

$$
=\left(\frac{1}{2} K V_{z y}^{3} V_{x y}^{-\frac{1}{2}}\right)^{-1}
$$

$$
=\frac{2 V_{x y}^{\frac{1}{2}}}{K V_{z y}^{3}}
$$

$$
\begin{gathered}
g_{m}=3 K V_{z y}^{2} V_{x y}^{\frac{1}{2}} \\
r_{o}=\frac{2 V_{x y}^{\frac{1}{2}}}{K V_{z y}^{3}}
\end{gathered}
$$

Rubric: (4 Points)

- +2: Correct $g_{m}$ expression
- +2 : Correct $r_{o}$ expression
(b) What is the intrinsic gain when the device is biased at $V_{z y}=V_{x y}=1 \mathrm{~V}$ ? Give a numerical answer.

## Solution:

$$
\begin{aligned}
A_{\nu 0} & =-g_{m} r_{o} \\
& =-\frac{6 V_{x y}}{V_{z y}} \\
& =-6 \frac{\mathrm{~V}}{\mathrm{~V}}
\end{aligned}
$$

$$
A_{\nu 0}=-6 \frac{\mathrm{~V}}{\mathrm{~V}}
$$

Rubric: (2 Points)

- +1 : Correct sign
- +1 : Correct magnitude

## 3. (Spring 2015 Midterm 1 Q4)

You have biased the amplifier below with a particular input overdrive voltage $V_{o v}$. Both devices are in saturation, and the quadratic model is appropriate.
The low frequency gain is $-1000 \frac{\mathrm{~V}}{\mathrm{~V}} . C_{g s 1}=1 \mathrm{pF}, C_{g d 1}=0.1 \mathrm{pF}$.

(a) What is the input capacitance? Give an exact numerical answer.

Solution: Taking into account the Millerized $C_{g d}$,

$$
\begin{aligned}
C_{\text {in }} & =C_{g s 1}+\left(1-A_{v 0}\right) C_{g d 1} \\
& =1 \mathrm{pF}+(1+1000) 0.1 \mathrm{pF} \\
& =1 \mathrm{pF}+100.1 \mathrm{pF} \\
& =101.1 \mathrm{pF}
\end{aligned}
$$

$$
C_{\mathrm{in}}=101.1 \mathrm{pF}
$$

Rubric: (2 Points)

- +1 : Correct magnitude
- +1: Correct sign
(b) You adjust the bias voltages so that the input overdrive $V_{o v 1}$ increases by a factor of two. What happens to the current, small signal parameters, low frequency gain, output pole frequency, output unity gain frequency, and input capacitance? Answers should be in the form "increase $5 \times$ ", "decrease $10 \times$ ", "stay the same", etc.

| $I_{D}$ |  |
| :---: | :--- |
| $g_{m}$ |  |
| $r_{o}$ |  |
| $\left\|A_{\nu 0}\right\|$ |  |
| $\omega_{p}$ |  |
| $\omega_{u}$ |  |
| $C_{\text {in }}$ |  |

## Solution:

| $I_{D}$ | Increase $4 \times$ |
| :---: | :--- |
| $g_{m}$ | Increase $2 \times$ |
| $r_{o}$ | Decrease $4 \times$ |
| $\left\|A_{\nu 0}\right\|$ | Decrease $2 \times$ |
| $\omega_{p}$ | Increase $4 \times$ |
| $\omega_{u}$ | Increase $2 \times$ |
| $C_{\text {in }}$ | Roughly decrease $2 \times$ |

Rubric: (14 Points)

- +2: Each correct answer ( $7 \times$ )

## 4. RC Low-Pass Filters

An RC low pass filter has a time constant of $1 \mu \mathrm{~s}$.
(a) With an input of $1 \mathrm{~V} \cdot \sin \left(10^{7} \frac{\mathrm{rad}}{\mathrm{s}} \cdot t\right)$, draw one cycle of the input and the steady state output. Label the amplitude and phase of the output.
Solution: Note that $\tau=R C$ has units in rad/s, not hertz! $\omega_{p}=\frac{1}{\tau}=1 \frac{\mathrm{Mrad}}{\mathrm{s}}$.
At the pole frequency, the magnitude is divided by $\sqrt{2}$. One decade above the pole frequency, the magnitude is $10 \times$ less than the input and the phase is $-90^{\circ}$ (think back to Bode plots!)

Rubric: (2 Points)

- +1 : Correct amplitude
- +1 : Correct phase
(b) Draw the response to a unit step voltage on a time scale of $1 \mathrm{~ms}, 1 \mu \mathrm{~s}$, and 1 ns .

Solution: Zooming in, things look pretty linear at really small timescales

Rubric: (3 Points)

- +1 : Correct error or value for one time scale $(3 \times)$

## 5. (Spring 2016 Midterm 1 Q6)

The four transistors shown below are all biased at a current of $1 \mu \mathrm{~A}$ at room temperature.
The NMOS device M1 is in sub-threshold, with $V_{G S}-V_{t}=-200 \mathrm{mV}$ and $n=1.5$.
The NMOS device M2 is velocity saturated with $V_{G S}-V_{t}=100 \mathrm{mV}$.
The NMOS device M3 is in saturation, with a channel field of approximately $0.1 \mathrm{~V} / \mu \mathrm{m}$ and $V_{G S}-V_{t}=$ 100 mV .

(a) Approximately what change in $V_{B E}$ will cause the collector current to increase by a factor of 10 ?

Solution:

$$
\begin{aligned}
V_{B E} & \approx \frac{k_{B} T}{q} \ln \left(\frac{I_{E}}{I_{0}}\right) \\
V_{B E}+\Delta V_{B E} & =\frac{k_{B} T}{q} \ln \left(\frac{10 I_{E}}{I_{0}}\right) \\
& =\frac{k_{B} T}{q} \ln \left(\frac{I_{E}}{I_{0}}\right)+\frac{k_{B} T}{q} \ln (10) \\
& =V_{B E}+\frac{k_{B} T}{q} \ln (10)
\end{aligned}
$$

$$
\Delta V_{B E}=\frac{k_{B} T}{q} \approx 60 \mathrm{mV}
$$

## Rubric: (2 Points)

- +1: Correct equation
- +1: Correct numerical value
(b) Approximately what change in $V_{G S 1}$ will cause the drain current in M1 to increase by a factor of 10 ? Solution:

$$
\begin{aligned}
I_{D} & =I_{0} \cdot \exp \left(\frac{V_{G S}-V_{t}}{n}\left(\frac{q}{k_{B} T}\right)\right) \\
V_{G S}-V_{t} & =n \frac{k_{B} T}{q} \ln \left(\frac{I_{D}}{I_{0}}\right) \\
V_{G S}+\Delta V_{G S}-V_{t} & =n \frac{k_{B} T}{q} \ln \left(\frac{10 I_{D}}{I_{0}}\right) \\
& =n \frac{k_{B} T}{q} \ln \left(\frac{I_{D}}{I_{0}}\right)+n \frac{k_{B} T}{q} \ln (10) \\
\Delta V_{G S} & =n \frac{k_{B} T}{q} \ln (10)
\end{aligned}
$$

$$
\Delta V_{G S}=n \frac{k_{B} T}{q} \ln (10) \approx 90 \mathrm{mV}
$$

Rubric: (2 Points)

- +1: Correct equation
- +1 : Correct numerical value
(c) Approximately what change in $V_{G S 2}$ will cause the drain current in M2 to increase by a factor of 10 ? Solution:

$$
\begin{aligned}
I_{D} & =C\left(V_{G S}-V_{t}\right) \\
C\left(V_{G S}+\Delta V_{G S}-V_{t}\right) & =10 C\left(V_{G S}-V_{t}\right) \\
\Delta V_{G S} & =9\left(V_{G S}-V_{t}\right)
\end{aligned}
$$

$$
\Delta V_{G S}=9\left(V_{G S}-V_{t}\right)=900 \mathrm{mV}
$$

Rubric: (2 Points)

- +1 : Correct equation
- +1: Correct numerical value
(d) Approximately what change in $V_{G S 3}$ will cause the drain current in M3 to increase by a factor of 10 ? Solution:

$$
\begin{aligned}
I_{D} & =C\left(V_{G S}-V_{t}\right)^{2} \\
C\left(V_{G S}+\Delta V_{G S}-V_{t}\right)^{2} & =10 C\left(V_{G S}-V_{t}\right)^{2} \\
V_{G S}+\Delta V_{G S}-V_{t} & =\sqrt{10}\left(V_{G S}-V_{t}\right) \\
\Delta V_{G S} & =\left(V_{G S}-V_{t}\right)(\sqrt{10}-1)
\end{aligned}
$$

$$
\Delta V_{G S}=\left(V_{G S}-V_{t}\right)(\sqrt{10}-1) \approx 216 \mathrm{mV} \approx 200 \mathrm{mV}
$$

Rubric: (2 Points)

- +1 : Correct equation
- +1 : Correct numerical value

## 6. (Fall 2009 Midterm 1 Q1)

For the following problems, the drain, gate, and source voltages are given. You may assume $V_{S B}=0 \mathrm{~V}$ and that $V_{t n}=-V_{t p}=0.5 \mathrm{~V}$. Indicate if the devices are off, in the linear or triode region, or in saturation. If the devices are in saturation, calculate $\left|V_{d s a t}\right|$.

## Solution:

|  | (a) | (b) | (c) | (d) | (e) | (f) | (g) | (h) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Off/Lin/Sat | Off | Sat | Lin | Sat | Sat | Sat | Off | Sat |
| $V_{\text {dsat }}$ (if Sat) |  | 0.5 |  | 1.5 | 0.5 | 0.5 |  | 1.5 |

Rubric: (16 Points)

- +1 : Each correct answer

## 7. Common Source Amp Design

The parameters for a particular $0.5 \mu \mathrm{~m}$ CMOS process are:

- $C_{o x}=5 \frac{\mathrm{fF}}{\mu \mathrm{m}^{2}}$
- $\mu_{n} C_{o x}=2 \mu_{p} C_{o x}=200 \frac{\mu \mathrm{~A}}{\mathrm{~V}^{2}}$
- $V_{t n}=-V_{t p}=0.5 \mathrm{~V}$
- $C_{o l}=0.5 \frac{\mathrm{fF}}{\mu \mathrm{m}}$
- $\lambda=\frac{1}{10 \mathrm{~V}}$ when $L=0.5 \mu \mathrm{~m}$
- $V_{D D}=2 \mathrm{~V}$
(a) Design an NMOS-input common source amplifier with a PMOS load with a low frequency gain of approximately $200 \mathrm{~V} / \mathrm{V}$, a unity gain frequency of $1 \mathrm{Grad} / \mathrm{s}$ with a 1 pF load, and an output swing of at least 300 mV to 2.2 V with a 2.5 V single-sided supply. Minimize power consumption. Clearly indicate what values you are using for $g_{m}, r_{o}, I_{D}, V_{d s a t}$, gate bias, $W$, and $L$ for each transistor. Clearly indicate which parameters you "pick", and which you solve for. Calculate the input capacitance.
Solution:

This is a lot to take in! We'll deal with these by groupings of large(ish) signal vs. small signal:
Output swing: This puts a lower bound on the overdrive voltage we can have for our devices (that is, it can't exceed 300 mV ). $\longrightarrow V_{\text {ovn }}, V_{\text {ovp }} \leq 300 \mathrm{mV}$.

Looking at the small signal specifications we're trying to meet:

$$
\begin{aligned}
A_{\nu 0} & =g_{m} R_{o} \approx 200 \\
\omega_{u} & =\frac{g_{m}}{C_{\text {out }}} \approx 1 \mathrm{Grad} / \mathrm{s}
\end{aligned}
$$

Note that we used $C_{\text {out }}$ rather than just $C_{L}$-if you have large devices, it could be that $C_{\text {out }}$ is significantly larger than $C_{L}$. We could write down more equations, but it wouldn't really get us anywhere, so we need to choose a starting point.

## The "I'm Taking The Exam and We Don't Get Calculators" Solution

The following is just an example of a design methodology which assumes you're taking an exam and don't have time to write code to actually check this super rigorously; you're by no means required to follow it exactly or even remotely closely.
i. Choose the output bias to be $V_{D D} / 2$. This puts us almost-not-quite in velocity saturation, but for the sake of simplicity we'll assume we're in saturation $\longrightarrow\left(\frac{W}{L}\right)_{p}=2\left(\frac{W}{L}\right)_{n}$, so $V_{\text {ovp }}=V_{\text {ovn }}$
ii. Another common starting point is choosing a $V_{o v}$ of our devices. A standard "safe" overdrive voltage is around 200 mV , and by safe we mean robust against process/temperature/etc. variation. $\longrightarrow V_{o v}=200 \mathrm{mV}$
iii. Now we have a decent starting point, so consider the following equations:

$$
\begin{aligned}
g_{m} & =\frac{2 I_{D}}{V_{o v}} \\
R_{o} & =\frac{r_{o}}{2}=\frac{1}{2 \lambda I_{D}} \\
A_{\nu 0} & =\frac{1}{V_{o v} \lambda} \geq 200 \\
\lambda & \leq \frac{1}{200 \cdot 200 \mathrm{mV}} \\
& =0.025 \mathrm{~V}^{-1}
\end{aligned}
$$

and so we have to scale up our channel length to meet our gain requirement $\longrightarrow L=2 \mu \mathrm{~m}$
iv. At this point, all we have left to choose is $W$ ! Why is this? We've chosen our bias voltages, and $I_{D}, g_{m}$, and $r_{o}$ are now fixed except for a linear (or inverse) relationship to $W$. To minimize power, we want to find the smallest $W$ which still allows us to meet our small signal specification.
The equations that we'll use to verify everything:

$$
\begin{aligned}
I_{D} & =\frac{1}{2} \mu C_{o x}\left(\frac{W}{L}\right) V_{o v}^{2}\left(1+\lambda V_{D S}\right) \\
\omega_{u} & =\frac{g_{m}}{C_{\text {out }}}
\end{aligned}
$$

This is where hand-iteration becomes more tenable, so we'll start by saying that $C_{\text {out }}=1.1 \times$ $C_{L}$ as a safe starting point. Then we can say that

$$
g_{m}=\frac{\omega_{u}}{C_{\mathrm{out}}}
$$

to find the minimum $W$ necessary to meet our specification. Then we go back and confirm that it actually works by explicitly finding $C_{\text {out }}$ :

$$
C_{\mathrm{out}} \approx C_{L}+C_{g d p}+C_{d s p}+C_{d s n}
$$

and iterate with the new $C_{\text {out }}$ until we've converged on a $W$.
And then finally the equation for calculating input capacitance:

$$
C_{i n} \approx C_{g s n}+C_{g d n}\left(1+g_{m} R_{o}\right)
$$

## The "We Have the Technology!" Solution

If you really want to minimize power, it's best to take advantage of the technology you have and make absolutely sure that you've exhausted all the possibilities for bias points. More specifically, rather than starting out by choosing an input/output bias, you would sweep both of them and test every single point to find one which meets your specification while consuming the smallest amount of $I_{D}$. The same goes for "choosing" $V_{o v}$ of your devices; otherwise, the rest of the design methodology is largely the same.

## Good Practice for the Real World

- Keep your devices the same channel length
- Make your devices integer multiples of a single width.

Side Note: When we perform all these calculations for gain, bandwidth, etc., we assume linear models for our devices. That is, we assume the input signal isn't large enough to effectively change the DC bias of our components; in reality, this often isn't true and is something that needs to be addressed more carefully (something you'll see in 240B!)
Rubric: (10 Points)

- +1 : Correct equation for DC gain
- +1 : Correct equation for $\omega_{u}$
- +1 : Correct lower bound for output swing
- +1 : Correct upper bound for output swing
- +1: Correct equation for input capacitance (with reasonable approximation) including Millerized $C_{g d n}$
- +1: Correct equation for consumed power
- +4: Chose some starting point and from there made a reasonable effort at design
(b) How much could you change the input capacitance if you were primarily optimizing to minimize that? Solution:

In the example solution for minimizing power, we chose a starting point of bias voltages, calculated the necessary $L$, then and minimized $W$ of our devices. Because our $L$ is already fixed by our bias point, the strategy for minimizing power consumption above minimizes $C_{i n}$ for that particular bias point.

If you wanted to be more aggressive, you could start by choosing (or sweeping) $L$ first, then adjust your bias point to meet your gain and GBW spec (if it's even possible-sometimes it isn't!), and then finally minimize $W$.

## Rubric: (5 Points)

- +2: Equation for input capacitance
- +3 : Some reasonable explanation of how previous part's methodology could be altered to minimize $C_{\text {in }}$

## 8. Common Source With No Calculator

An NMOS common source amplifier has a 10 V supply and a $1 \mathrm{k} \Omega$ load (to the supply) in parallel with 100 pF . Assume $\mu_{n} C_{o x}=20 \mu \mathrm{~A} / \mathrm{V}^{2}, W / L=10,000 / 1, V_{t n}=1 \mathrm{~V}$, and $\lambda=0.01 \mathrm{~V}$. You should be able to do all of the calculations by hand (without calculators). One-ish significant digits is fine.

(a) Write an expression for $I_{D}$ as a function of output bias point. How much does $I_{D}$ change as the output voltage varies from 9 V to 1 V ?
Solution: First, we know

$$
I_{D}=\frac{V_{D D}-V_{O U T}}{R_{L}}
$$

Using this $V_{\text {OUT }} \in\{1,9\} \mathrm{V}$ :

$$
\begin{aligned}
I_{D}\left(V_{\text {OUT }}=9 \mathrm{~V}\right) & =\frac{10-9}{10^{3}} \frac{\mathrm{~V}}{\Omega} & I_{D}\left(V_{\text {OUT }}=1 \mathrm{~V}\right) & =\frac{10-1}{10^{3}} \frac{\mathrm{~V}}{\Omega} \\
& =1 \mathrm{~mA} & & =9 \mathrm{~mA}
\end{aligned}
$$

$$
\begin{gathered}
I_{D}=\frac{V_{D D}-V_{\text {OUT }}}{R_{L}} \\
I_{D}\left(V_{\text {OUT }}=9 \mathrm{~V}\right)=1 \mathrm{~mA} \\
I_{D}\left(V_{\text {OUT }}=1 \mathrm{~V}\right)=9 \mathrm{~mA}
\end{gathered}
$$

Rubric: (3 Points)

- +1 : Correct $I_{D}$ equation
- +1 : Correct $I_{D}$ value $(2 \times)$
(b) What is the change in the input and overdrive voltage as the output varies from 9 V to 1 V ?

Solution: Using the expression for overdrive voltage and our answer to the previous part to find the current,

$$
\begin{aligned}
V_{o v} & =\sqrt{\frac{2 I_{D}}{\mu C_{o x}\left(\frac{W}{L}\right)}} \\
V_{o v}\left(I_{D}=1 \mathrm{~mA}\right) & =0.1 \mathrm{~V} \\
V_{o v}\left(I_{D}=9 \mathrm{~mA}\right) & =0.3 \mathrm{~V}
\end{aligned}
$$

$$
\begin{aligned}
& @ V_{O U T}=9 \mathrm{~V}: V_{o v}=0.1 \mathrm{~V}, V_{G S}=1.1 \mathrm{~V} \\
& @ V_{O U T}=1 \mathrm{~V}: V_{O v}=0.3 \mathrm{~V}, V_{G s}=1.3 \mathrm{~V}
\end{aligned}
$$

Rubric: (3 Points)

- +1 : Correct $V_{G S}$ equation
- +1 : Correct $V_{o v}$ value $(2 \times)$
(c) Write an expression for $g_{m}$ and $r_{o}$ as a function of output bias point.

## Solution:

$$
\begin{aligned}
g_{m} & =\sqrt{2 \mu_{n} C_{o x}\left(\frac{W}{L}\right)\left(\frac{V_{D D}-V_{O U T}}{R_{L}}\right)} \\
r_{o} & =\frac{R_{L}}{\lambda\left(V_{D D}-V_{O U T}\right)}
\end{aligned}
$$

Rubric: (2 Points)

- +1 : Correct $g_{m}$ equation
- +1 : Correct $r_{o}$ equation
(d) Write an expression for $a_{v 0}$-the intrinsic gain of the NMOS—as a function of output bias point. Solution:

$$
A_{v 0}=\frac{\sqrt{2 \mu_{n} C_{o x}\left(\frac{W}{L}\right)\left(\frac{R_{L}}{V_{D D}-V_{O U T}}\right)}}{\lambda}
$$

Rubric: (2 Points)

- +2: Correct intrinsic gain. If you approximated and derivated overall gain, that's fine too.
(e) Fill in the following table given the output bias point. Be sure to specify your units!

| Output Bias Point | $I_{D}$ | $g_{m}$ | $r_{o}$ | $A_{v 0}$ | $\omega_{p}$ | $\omega_{u}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 9 V |  |  |  |  |  |  |
| 6 V |  |  |  |  |  |  |
| 1 V |  |  |  |  |  |  |

## Solution:

| Output Bias Point | $I_{D}$ | $g_{m}$ | $r_{o}$ | $A_{v 0}$ | $\omega_{p}$ | $\omega_{u}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 9 V | 1 mA | 20 mS | $100 \mathrm{k} \Omega$ | 20 | $10 \mathrm{Mrad} / \mathrm{s}$ | $200 \mathrm{Mrad} / \mathrm{s}$ |
| 6 V | 4 mA | 40 mS | $25 \mathrm{k} \Omega$ | 40 | $10 \mathrm{Mrad} / \mathrm{s}$ | $400 \mathrm{Mrad} / \mathrm{s}$ |
| 1 V | 9 mA | 60 mS | $11.1 \mathrm{k} \Omega$ | 60 | $10 \mathrm{Mrad} / \mathrm{s}$ | $600 \mathrm{Mrad} / \mathrm{s}$ |

## Rubric: (18 Points)

- +1: Correct $g_{m}, r_{o}, a_{v 0}, \omega_{p}$, and $\omega_{u}$ given the output bias value. $(5 \times)$.
- Don't double-penalize-wrong $I_{D}$ is -1 , but the resulting $r_{o}$ can still get credit if it was calculated correctly with the wrong $I_{D}$ value.
