

EECS192 Lecture 7

Mar. 1, 2016

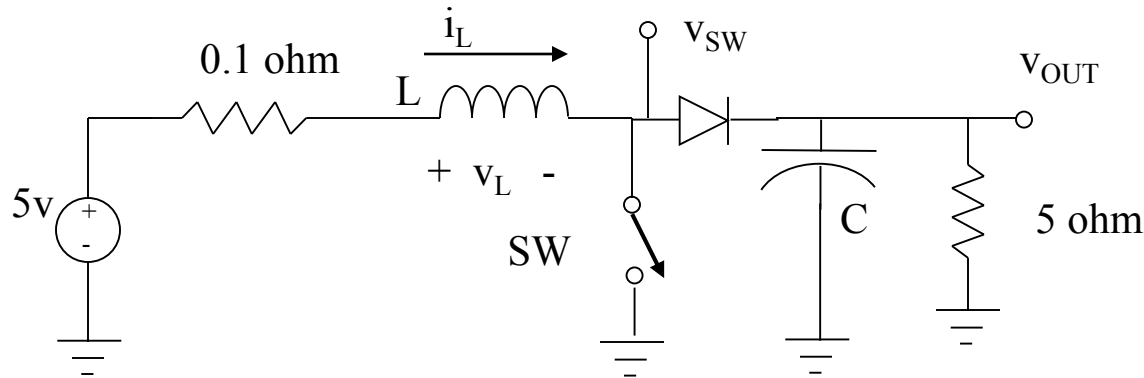

Notes:

1. Check off-
 - 3/4/2016 : benchtop line tracking (line camera+servo)
 - 3/11/2016: drop-and-run, velocity control
2. Community Spirit: PCB peer review, Piazza, helping fellow students
3. CalDay Sat. April 16 @ UCB, Freescale Cup at UC Davis

Topics

- Quiz 3 boost converter
- Line sensor- processing
 - Automatic Gain Control
 - Edge detection/fitting
 - Sanity check: median/outlier
- iPython notebook (under Resources on Piazza)
- Speed sensing/velocity control

Boost converter- Quiz 3

Average $V_{out} = 10V$. Switch and diode are assumed ideal. Switch has 30% duty cycle as shown below.

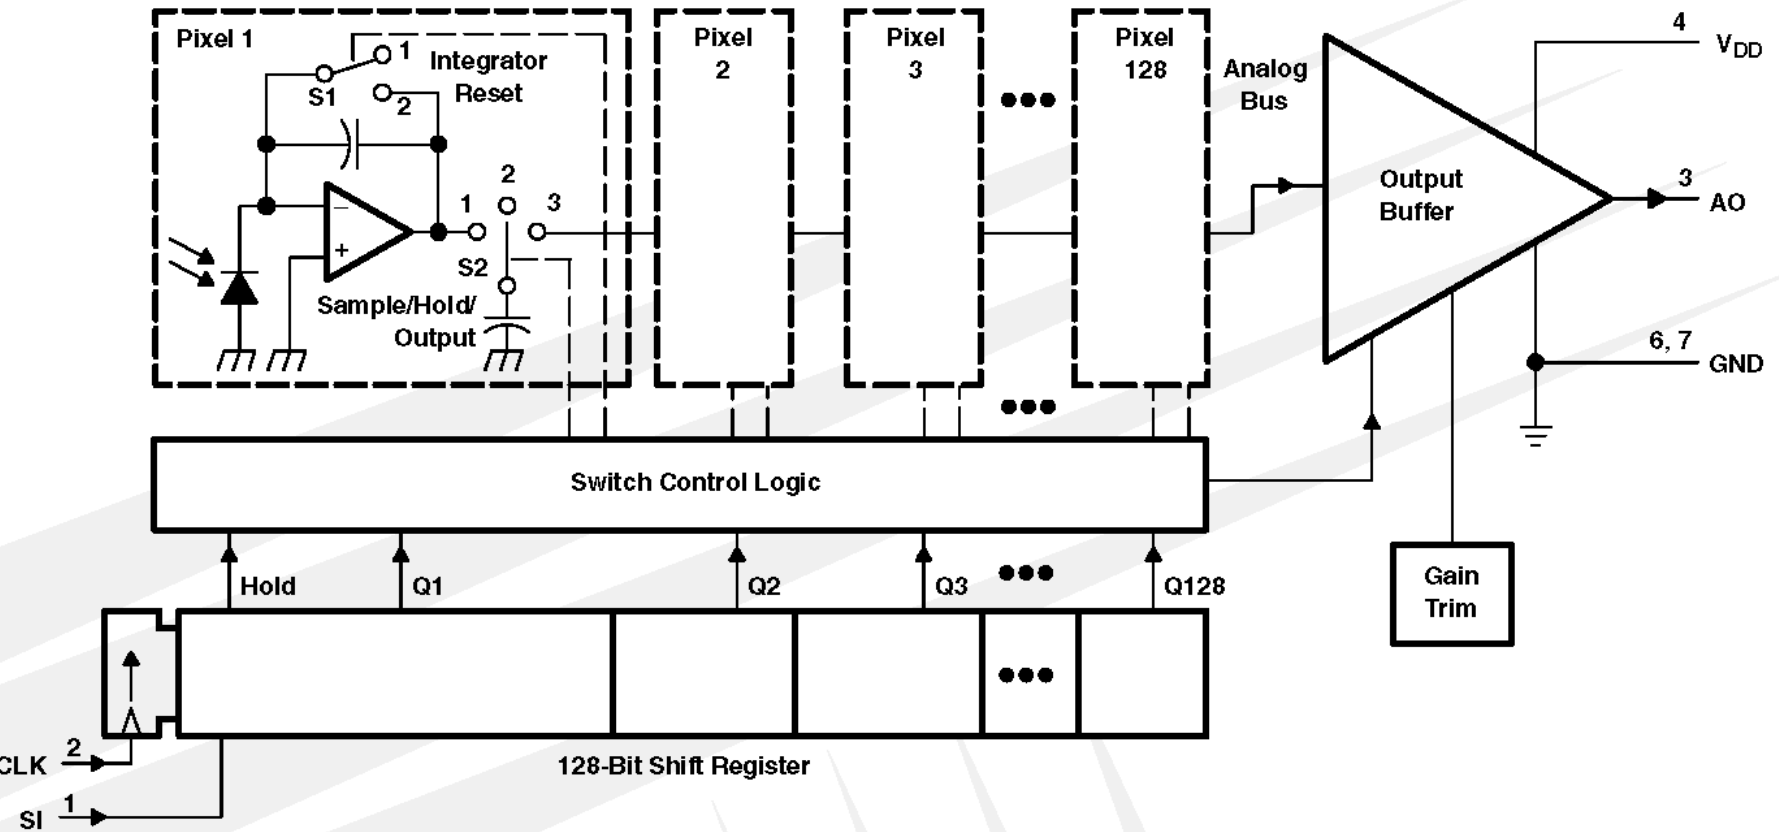

- What is the approximate power dissipation in the 5 ohm resistor? _____ W
- What is the change in capacitor energy from $t=0$ to $t=3$ us? _____ Joules
- What is the change in capacitor energy from $t=3$ to $t=10$ us? _____ Joules
- Complete the sketch for i_L , v_L , v_{SW} , and v_{OUT} . Assume that the circuit has reached steady state operating conditions, and that switching is fast enough that piecewise linear approximations are valid. **Note peak values for v_L and v_{sw} .**
