

# EECS 192: Mechatronics Design Lab

## Discussion 1: Introduction

written by: Richard "Ducky" Lin 📧 Spring 2015

20 Jan 2016 (Week 1)

- Administrivia
- FRDM Board Intro
- Soldering

# Welcome

Welcome to EE192!

# Project

- ▶ Project: build an autonomous track-following racecar given a stock chassis and microcontroller dev kit
- ▶ Teams should be 3 students
  - ▶ Combined skillset should include mechanical design / fabrication, electronics, programming
  - ▶ Controls experience helpful
- ▶ Teams formed by checkoff Friday
- ▶ Read the competition rules
  - ▶ Freescale Cup
  - ▶ NATCAR

# Checkoffs

- ▶ One-hour time slot on Friday 11:30am-12:30pm to demonstrate that your project is where it should be
- ▶ At least one team member needs to show up to run your hardware
- ▶ These are graded, half credit if late
- ▶ First checkoff this Friday
  - ▶ Form project teams and check out cars
  - ▶ Checks4Cars program: trade a \$300 deposit check for a car
  - ▶ Get private course GitHub repository
  - ▶ Details on website

Get your cars!

# Git Refresher

- ▶ Git: distributed version control software
  - ▶ Each commit: like complete snapshot
  - ▶ Branches: separate chains of commits
    - ▶ eventually merged back to its parent
  - ▶ Distributed: everyone has complete copy
    - ▶ Most operations local, periodically sync
- ▶ Best Practices
  - ▶ Small, logical, often commits
  - ▶ Write good commit messages
  - ▶ Develop in branches: keep master clean

# Hardware

- ▶ FRDM-KL25Z Development Board
- ▶ MKL25Z128VLK4 microcontroller
  - ▶ 48MHz ARM Cortex-M0+
  - ▶ 128KB flash
  - ▶ 16KB SRAM
- ▶ Programmable using USB
- ▶ I/O headers including
  - ▶ GPIO
  - ▶ 16-bit analog inputs (ADC)
  - ▶ 12-bit analog output (DAC)
  - ▶ PWM, I<sup>2</sup>C, SPI, and UART modules
- ▶ On-board RGB LED and accelerometer

FRDM-KL25Z Board

image from KL25Z User's Manual

# IO Refresher

## ▶ GPIO (general purpose input/output) pins

<http://developer.mbed.org/handbook/DigitalOut>

<http://developer.mbed.org/handbook/DigitalIn>

- ▶ As an output: sets voltage on pin from software, either GND (0) or Vdd (1)
- ▶ As an input: samples voltage on the pin, returning either 0 (low) or 1 (high)

## ▶ PWM (pulse-width modulation) module

<http://developer.mbed.org/handbook/PwmOut>

- ▶ Every *period*, the pin is high based on the *duty cycle*, then low for the remainder
- ▶ Can digitally approximate analog outputs

## ▶ Analog Inputs (ADC)

<http://developer.mbed.org/handbook/AnalogIn>

- ▶ Converts a continuous analog voltage (0-3.3v) to a 16-bit (0-65535) quantity

FRDM-KL25Z pinout

image from ???

# Concurrency Refresher

- ▶ FRDM-KL25Z's processor is single core
- ▶ Blocking Operations
  - ▶ Operations do not return until finished, blocking thread of control
  - ▶ IO operations may be lengthy!
- ▶ Nonblocking Operations
  - ▶ Operations return immediately, activity continues in the "background"
  - ▶ IO operations can buffer data and use interrupts to send/receive data
- ▶ Threading and RTOS

<http://developer.mbed.org/handbook/RTOS>

- ▶ mBed has a RTOS with threading, concurrency, and synchronization
- ▶ Beware of threading anti-patterns

# “Hello, World!” Code

```

MODSERIAL serial(USBTX, USBRX);

DigitalOut led_green(LED_GREEN);
DigitalOut led_red(LED_RED);
PwmOut led_blue(LED_BLUE);

int main() {
    // Internal LED is active low.
    led_green = 0;
    wait(0.25);
    led_green = 1;
    wait(0.25);

    // Mandatory "Hello, world!".
    serial.printf("Hello, world!\n");

    // Run led_fade_thread() in own thread
    Thread ledFadeThread(led_fade_thread);

    // Periodically call led_blink_periodic()
    RtosTimer ledBlinkTimer(led_blink_periodic);
    ledBlinkTimer.start(1000);

    // Work is done in the threads,
    // so main() can sleep.
    Thread::wait(osWaitForever);
}

void led_fade_thread(
    void const *args) {
    // Note this doesn't terminate.
    while (1) {
        // Invert duty cycle.
        led_blue.write(1-0);
        Thread::wait(250);
        led_blue.write(1-0.25);
        Thread::wait(250);
        led_blue.write(1-0.5);
        Thread::wait(250);
        led_blue.write(1-0.75);
        Thread::wait(250);
    }
}

void led_blink_periodic(
    void const *args) {
    // Toggle the red LED when called.
    led_red = !led_red;
}

```

# Hello, World! Demo

## Live Demo!

*Note- check bootloader version: Bootloader version 1.11 and MSD  
firmware version 1.14.*

**D:FRDM-KL25Z:SDAINFO.HTM**

This is essentially the procedure demonstrated in the checkpoint 1 page

... and hopefully goes Murphy-free ...

Note: you'll have to download the Device Family Pack for the FRDM-KL25Z

<http://www.keil.com/dd2/arm/armcm0/>  
(also on the checkpoint page)

# Overview

- ▶ Soldering: joining (electrically and mechanically) metals using a separate filler metal "*solder*"
- ▶ Electronics: bonding component pins/leads to circuit board through-holes or pads
  - ▶ Solder is usually a tin/lead alloy (e.g. 63/37) or lead-free tin-silver-copper alloy (e.g. SAC305)
- ▶ This tutorial focuses on introductory through-hole soldering
  - ▶ Note: most production boards today are surface-mount to save space

Example solder joints:

Through-hole

Surface-mount

# Safety Precautions

- ▶ Soldering melts metal - IT'S HOT
  - ▶ Tips typically set at  $\leq 600^{\circ}\text{F}$  ( $300^{\circ}\text{C}$ ) to avoid tip oxidation.
  - ▶ Irons can stay hot after turning off
  - ▶ Touching a hot tip is NOT fun
- ▶ Leaded solder contains, well, lead...
  - ▶ ... which is known to the state of California to cause cancer and reproductive harm ...
  - ▶ WASH YOUR HANDS AFTERWARDS
- ▶ Solder vaporizes flux, producing fumes
  - ▶ Regular exposure linked to asthma
  - ▶ DON'T BREATHE THEM IN
  - ▶ May also cause solder splatter: safety goggles recommended

Lead poisoning:  
not as fun in real life

©Fox

# Oxidation

- ▶ Soldering depends on good thermal transfer from tip to solder / component / board
- ▶ Metals oxidize, forming an oxide layer
  - ▶ Oxides impede thermal transfer
  - ▶ Reactions faster at higher temperatures
- ▶ Flux provides chemical cleaning
  - ▶ Rosin flux is corrosive when heated
  - ▶ ... and is present in solder wire spools
  - ▶ ... but is “burned” upon use
- ▶ Just keep this in mind...

Solder cross-section showing flux core

# Equipment Overview

## Soldering Iron Base

## Soldering Iron Handpiece

## Tip (cutaway view)

**Caution:** These parts get very hot during operation! Do NOT touch until cool!

# Tip Maintenance

- ▶ The tip is what heats things up
  - ▶ Want to maximize thermal transfer!
- ▶ Keep the tip “tinned” with solder
  - ▶ Provides better thermal transfer
  - ▶ Sacrificial layer preventing tip oxidation, which destroys the tip
- ▶ Must be occasionally refreshed
  - ▶ The solder oxidizes, accelerated by heat
  - ▶ Cleaning: wipe on brass or wet sponge
  - ▶ Immediately re-tin (apply solder layer)

# Procedure

- ▶ Beginner's tip: use iron to heat up component and board, not solder
  - ▶ Feed solder in through the other side
  - ▶ Solder only melts when component and board sufficiently hot
- ▶ Maximizing heat transfer
  - ▶ Point tips: solder using "side" of tip, not point
  - ▶ Chisel tips: use the broad flat end

## Soldering Procedure

# Joint Inspection

Optimal joint shape is a “solder volcano”

## Common Joints

**Good**  
Concave shape  
Adheres to board  
and component

**Bad**  
Not enough solder

**Bad**  
Too much solder  
(convex shape)

Cold Joints, may not make a reliable electrical connection

**Awful**  
Solder did not  
adhere to board

**Awful**  
Solder did not  
adhere to  
component  
May not be obvious  
at a glance

# Through-Hole Soldering Demo

## Live Demo!

... which REALLY hopefully goes Murphy-free ...

# Scheduling

- ▶ Quick poll: best time for GSI office hours? (about 2 per week)
  - ▶ Thursday, for the pre-checkoff scramble?
  - ▶ Other times?
- ▶ Thursday section only: has schedules cleared up enough to move discussion to Wednesday?
  - ▶ Otherwise, future discussion sections (starting Thu, 29 Jan) will be 9:30am-10:30am

# Electrostatic Discharge

- ▶ You build up static charge on your body
  - ▶ ... just by walking, especially when it's dry
  - ▶ ... and up to several kV
  - ▶ but under  $\sim 2\text{kV}$  is imperceptible
- ▶ Chips are sensitive to high voltages:  
**may cause permanent damage**
  - ▶ read: board stops working “for no reason”
- ▶ Remember to ground (discharge) yourself before handling sensitive electronics
  - ▶ Touch the grounded lab bench surface
  - ▶ Use a ESD wriststrap
  - ▶ Avoid touching traces on boards

Don't let this happen  
to you

Get your parts and get started!

I'll be walking around helping!

For checkpoint 1, you need to solder a resistor and LED onto perfboard

Choose the resistor such that  $\sim 1.6\text{mA}$  goes through the LED

The MCU supply voltage is 3.3v

(yes, I know those red LEDs suck)

Also, grab a computer account form!
