Def.  Projection: is mathematical operation that is similar to the physical operation of taking an X-ray photograph with a collimated beam of radiation.
\[ P_0(t) = \int_{u=-\infty}^{+\infty} f_c(t_1, t_2) \bigg|_{t_1 = t \cos \theta - u \sin \theta, \ t_2 = t \sin \theta + u \cos \theta} \ du \]

**Goal:** Relate 2D F.T. of \( f_c \) to 1D F.T. of \( P_0 \)

**Projection Slice Theorem:**

\[ F_c(r_1, r_2) = 2D \text{C.T.F.T.} \{ f_c(t_1, t_2) \} \]
\[ F_c(r_1, r_2) = \int_{t_1=-\infty}^{+\infty} \int_{t_2=-\infty}^{+\infty} f_c(t_1, t_2) e^{-j 2 \pi r_1 t_1 - j 2 \pi r_2 t_2} dt_1 dt_2 \]
\[ f_c(t_1, t_2) = \frac{1}{4\pi^2} \int_{r_1} \int_{r_2} F_c(r_1, r_2) e^{j 2 \pi r_1 t_1} e^{j 2 \pi r_2 t_2} dr_1 dr_2 \]
\[ P_\theta (r) = \text{I.D. C.T.F.T.} \left\{ P_\theta (t) \right\} \]

\[ P_\theta (r) = \int_{t=-\infty}^{+\infty} P_\theta (t) e^{-j2\pi rt} \, dt \]

\[ t = -r \]

---

**Projection Slice Theorem:**

\[ P_\theta (r) = F_c (r_1, r_2) \bigg| \begin{array}{l} r_1 = r \cos \theta \\ r_2 = r \sin \theta \end{array} \]

\[ P_\theta (r) = F_c (r \cos \theta, r \sin \theta) \]
By taking multiple projections, you get 2D F.T. of the object. Inverse 2D F.T. you get the object $f(x_1, x_2)$.
Polar Sampling: Every angle spacing samples in Fourier domain are equal.
To get blue cartesian samples from red polar samples, interpolate:

- Zeroth order \( \rightarrow \) nearest neighbor
- 1st order \( \rightarrow \) weighted sum of neighboring sample.

Concentric Squares: Distance between projection samples in F.D. varies as a function of projection angle.
Reconstruction Strategies

1. Simple

2. Radon Inversion Formula

3. Iterative Technique
Forward Inversion Formula

\[ f_c(t_1, t_2) = \frac{1}{4\pi^2} \int_0^\infty \int_{-\infty}^\infty F_c(r_1, r_2) e^{j2\pi r_1 t_1} e^{j2\pi r_2 t_2} \, dr_1 \, dr_2 \]

1. Convert to polar coordinates: \( r_1, r_2 \rightarrow w, \theta \)

\[ f_c(t_1, t_2) = \frac{1}{4\pi^2} \int_0^\infty \int_{-\infty}^{+\infty} F_c(w \cos \theta, w \sin \theta) e^{j2\pi (w \cos \theta t_1 + w \sin \theta t_2)} \, |w| \, dw \, d\theta \]

\[ P_\theta(w) \]

\[ P_\theta(w) \quad \text{with } t = t_1 \cos \theta + t_2 \sin \theta \]

\[ I = \left\{ \mathcal{F} \left[ P_\theta(w) |w| \right] \right\} \]

10
Define \( G_\theta(w) = P_\theta(w) \mid w \mid \)

\[
F^{-1} \{ G_\theta(w) \} = g_\theta(t)
\]

\[
I = \int_{-\infty}^{\infty} G_\theta(w) e^{\text{j}w(t_1 \cos \theta + t_2 \sin \theta)} \, dw
\]

\[
I = \left[ g_\theta(t) \right]_{t = t_1 \cos \theta + t_2 \sin \theta}
\]

\[
J = g_\theta(t_1 \cos \theta + t_2 \sin \theta)
\]

\[
f_\theta(t_1, t_2) = \frac{1}{4\pi^2} \int_{0}^{\pi} g_\theta(t_1 \cos \theta + t_2 \sin \theta) \, d\theta
\]
Recall $G_{\Theta}(\omega) = |P_{\Theta}(\omega)|$ $|\omega|$

$g_{\Theta}(t) = k(t) * P_{\Theta}(t)$

where $k(t) = \mathcal{F}^{-1}\{ |\omega| \}$

$\Rightarrow g_{\Theta}(t) = \frac{1}{dt} \int_{-\infty}^{+\infty} P_{\Theta}(\tau) \frac{d\tau}{t-\tau}$

Step:
1. $P_{\Theta}(t)$
2. Convolve with $k(t)$ to get $g_{\Theta}(t)$
3. Plug $g_{\Theta}(t)$ into $\mathbb{G}$
at $t = t_0$

$\int_{t_0}^{t_2} = g(t_0)$
Iterative Recon

\[ f_c^K(t_1, t_2) = f_c^{K-1}(t_1, t_2) + \]

\[ \sum_{i=1}^{N} \lambda_i \left[ P_{\Theta_i}(t_1 \cos \Theta_i + t_2 \sin \Theta_i) - D_i \{ f_c^{K-1}(t_1, t_2) \} \right] \]

filter gain increases with increasing frequency, high-frequency noise will be amplified. Thus to minimize the deterioration that can result from such noise, the filter $k(t)$ is typically chosen to have an approximately linear response out to some cutoff frequency beyond which the response goes to zero. The exact shape of the frequency response is also governed by computational convenience [20, 21].

Some reconstructions obtained using this algorithm are shown in Figures 7.17 and 7.18. The resolution here is noticeably better than for the reconstructions
