Color Image Processing
Color Fundamentals

FIGURE 6.1 Color spectrum seen by passing white light through a prism. (Courtesy of the General Electric Co., Lamp Business Division.)
FIGURE 6.2  Wavelengths comprising the visible range of the electromagnetic spectrum. (Courtesy of the General Electric Co., Lamp Business Division.)
Color Fundamentals

6 to 7 million cones in the human eye can be divided into three principal sensing categories, corresponding roughly to red, green, and blue.

65%: red 33%: green 2%: blue (blue cones are the most sensitive)
Figure 6.3
Absorption of light by the red, green, and blue cones in the human eye as a function of wavelength.
FIGURE 6.4
Primary and secondary colors of light and pigments. (Courtesy of the General Electric Co., Lamp Business Division.)
Color Fundamentals

The characteristics generally used to distinguish one color from another are brightness, hue, and saturation.

**brightness**: the achromatic notion of intensity.

**hue**: dominant wavelength in a mixture of light waves, represents dominant color as perceived by an observer.

**saturation**: relative purity or the amount of white light mixed with its hue.
Color Fundamentals

Tristimulus

Red, green, and blue are denoted X, Y, and Z, respectively. A color is defined by its trichromatic coefficients, defined as

\[
x = \frac{X}{X + Y + Z}
\]

\[
y = \frac{Y}{X + Y + Z}
\]

\[
z = \frac{Z}{X + Y + Z}
\]
CIE Chromaticity Diagram

It shows color composition as a function of x (red) and y (green).

FIGURE 6.5 Chromaticity diagram. (Courtesy of the General Electric Co., Lamp Business Division.)
FIGURE 6.7
Schematic of the RGB color cube. Points along the main diagonal have gray values, from black at the origin to white at point (1, 1, 1).
RGB Color Model

The total number of colors in a 24-bit RGB image is \((2^8)^3 = 16,777,216\)

**FIGURE 6.8** RGB 24-bit color cube.
FIGURE 6.9
(a) Generating the RGB image of the cross-sectional color plane \((127, G, B)\).
(b) The three hidden surface planes in the color cube of Fig. 6.8.
Safe RGB colors (or safe Web colors) are reproduced faithfully, reasonably independently of viewer hardware capabilities.
FIGURE 6.11  The RGB safe-color cube.
The CMY and CMYK Color Models

\[
\begin{bmatrix}
C \\
M \\
Y
\end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} - \begin{bmatrix} R \\ G \\ B \end{bmatrix}
\]

Equal amounts of the pigment primaries, cyan, magenta, and yellow should produce black. In practice, combining these colors for printing produces a muddy-looking black.

To produce true black, the predominant color in printing, the fourth color, black, is added, giving rise to the CMYK color model.
CMY vs. CMYK

http://en.wikipedia.org/wiki/CMYK
HSI Color Model

**brightness**: the achromatic notion of **intensity**.

**hue**: dominant wavelength in a mixture of light waves, represents dominant color as perceived by an observer.

**saturation**: relative purity or the amount of white light mixed with its hue.
FIGURE 6.12
Conceptual relationships between the RGB and HSI color models.
**FIGURE 6.13** Hue and saturation in the HSI color model. The dot is an arbitrary color point. The angle from the red axis gives the hue, and the length of the vector is the saturation. The intensity of all colors in any of these planes is given by the position of the plane on the vertical intensity axis.
FIGURE 6.14 The HSI color model based on (a) triangular and (b) circular color planes. The triangles and circles are perpendicular to the vertical intensity axis.
Converting Colors from RGB to HSI

Given an image in RGB color format, the H component of each RGB pixel is obtained using the equation

\[
H = \begin{cases} 
\theta & \text{if } B \leq G \\
360 - \theta & \text{if } B > G 
\end{cases}
\]

\[
\theta = \cos^{-1} \left\{ \frac{1}{2} \left[ (R - G) + (R - B) \right] \right\} \frac{1}{\left[ \left( R - G \right)^2 + (R - B)(G - B) \right]^{1/2}}
\]
Converting Colors from RGB to HSI

Given an image in RGB color format, the saturation component is given by

\[ S = 1 - \frac{3}{(R + G + B)} \min(R, G, B) \]
Converting Colors from RGB to HSI

Given an image in RGB color format, the intensity component is given by

\[ I = \frac{1}{3} (R + G + B) \]
Converting Colors from HSI to RGB

- **RG sector**  
  
  \[ 0^\circ \leq H < 120^\circ \]

\[
B = I(1 - S)
\]

\[
R = I \left[ 1 + \frac{S \cos H}{\cos(60^\circ - H)} \right]
\]

and

\[
G = 3I - (R + B)
\]
Converting Colors from HSI to RGB

RG sector \((120^\circ \leq H < 240^\circ)\)

\[
H = H - 120^\circ
\]

\[
R = I (1 - S)
\]

\[
G = I \left[ 1 + \frac{S \cos H}{\cos(60^\circ - H)} \right]
\]

and

\[
B = 3I - (R + G)
\]
Converting Colors from HSI to RGB

► RG sector \((240° \leq H \leq 360°)\)

\[ H = H - 240° \]
\[ G = I(1 - S) \]
\[ B = I \left[ 1 + \frac{S \cos H}{\cos(60° - H)} \right] \]

and
\[ R = 3I - (G + B) \]

(f) Image obtained in the same manner, but using in the red channel the near-infrared image in (d). (Original multispectral images courtesy of NASA.)
Pseudocolor by combining several of the sensor images from the Galileo spacecraft, some of which are in spectral regions not visible to the eye.

Bright red depicts materials newly ejected from an active volcano on Io, and the surrounding yellow materials are older sulfur deposits.
Basics of Full-Color Image Processing

Let \( c \) represent an arbitrary vector in RGB color space:

\[
c = \begin{bmatrix} c_R \\ c_G \\ c_B \end{bmatrix} = \begin{bmatrix} R \\ G \\ B \end{bmatrix}
\]

At coordinates \((x, y)\),

\[
c(x, y) = \begin{bmatrix} c_R(x, y) \\ c_G(x, y) \\ c_B(x, y) \end{bmatrix} = \begin{bmatrix} R(x, y) \\ G(x, y) \\ B(x, y) \end{bmatrix}
\]
Basics of Full-Color Image Processing

**Figure 6.29** Spatial masks for gray-scale and RGB color images.
Color Transformations

\[ g(x, y) = T \left[ f(x, y) \right] \]

\[ s_i = T_i(r_1, r_2, \ldots, r_n), \quad i = 1, 2, \ldots, n. \]
FIGURE 6.30 A full-color image and its various color-space components. Interactive.)
\[ g(x, y) = kf(x, y) \]

Color slicing

- Highlighting a specific range of colors in an image

If the colors of interest are enclosed by a cube of width $W$ and centered at a prototypical color with components $(a_1, a_2, ..., a_n)$, the necessary set of transformations is

$$s_i = \begin{cases} 
0.5 & \text{if } \left| r_j - a_j \right| > W/2 \text{ for any } 1 \leq j \leq n \\
 r_i & \text{otherwise}
\end{cases}$$
If a sphere is used to specify the colors of interest, $R_0$ is the radius of the enclosing of its center. The transformations is

\[
\begin{align*}
S_i &= \begin{cases} 
0.5 & \text{if } \sum_{j=1}^{n} (r_j - a_j)^2 > R_0^2 \\
 r_i & \text{otherwise}
\end{cases}
\end{align*}
\]
**FIGURE 6.34** Color-slicing transformations that detect (a) reds within an RGB cube of width $W = 0.2549$ centered at $(0.6863, 0.1608, 0.1922)$, and (b) reds within an RGB sphere of radius 0.1765 centered at the same point. Pixels outside the cube and sphere were replaced by color $(0.5, 0.5, 0.5)$. 
Tone and Color Corrections

FIGURE 6.35 Tonal corrections for flat, light (high key), and dark (low key) color images. Adjusting the red, green, and blue components equally does not always alter the image hues significantly.
FIGURE 6.37
Histogram equalization (followed by saturation adjustment) in the HSI color space.
Let $S_{xy}$ denote the set of coordinates defining a neighborhood centered at $(x,y)$ in an RGB color image. The average of the RGB component vectors in this neighborhood is

$$
\overline{c}(x,y) = \frac{1}{K} \sum_{(s,t) \in S_{xy}} c(s,t) = \begin{bmatrix}
\frac{1}{K} \sum_{(s,t) \in S_{xy}} R(s,t) \\
\frac{1}{K} \sum_{(s,t) \in S_{xy}} G(s,t) \\
\frac{1}{K} \sum_{(s,t) \in S_{xy}} B(s,t)
\end{bmatrix}
$$

(b) Red component image.
(c) Green component.
(d) Blue component.
**FIGURE 6.39** HSI components of the RGB color image in Fig. 6.38(a). (a) Hue. (b) Saturation. (c) Intensity.
Color Image Sharpening

The Laplacian of vector $c$ is

$$\nabla^2 [c(x, y)] = \begin{bmatrix} \nabla^2 R(x, y) \\ \nabla^2 G(x, y) \\ \nabla^2 B(x, y) \end{bmatrix}$$
FIGURE 6.41 Image sharpening with the Laplacian. (a) Result of processing each RGB channel. (b) Result of processing the HSI intensity component and converting to RGB. (c) Difference between the two results.
Image Segmentation Based on Color:

Segmentation in HSI Color Space

**FIGURE 6.42** Image segmentation in HSI space. (a) Original. (b) Hue. (c) Saturation. (d) Intensity. (e) Binary saturation mask (black = 0). (f) Product of (b) and (e). (g) Histogram of (f). (h) Segmentation of red components in (a).
Segmentation in RGB Vector Space

Let the average color of interest is denoted by the RGB vector \( a \). Let \( z \) denote an arbitrary point in RGB space.

\[
D(z, a) = \|z - a\| = \left[ (z - a)^T (z - a) \right]^{1/2} = \left[ (z_R - a_R)^2 + (z_G - a_G)^2 + (z_B - a_B)^2 \right]^{1/2}
\]
FIGURE 6.44
Segmentation in RGB space.
(a) Original image with colors of interest shown enclosed by a rectangle.
(b) Result of segmentation in RGB vector space. Compare with Fig. 6.42(h).
Color Edge Detection (1)

Let \( r, g, \) and \( b \) be unit vectors along the R, G, and B axis of RGB color space, and define vectors

\[
\mathbf{u} = \frac{\partial R}{\partial x} \mathbf{r} + \frac{\partial G}{\partial x} \mathbf{g} + \frac{\partial B}{\partial x} \mathbf{b}
\]

and

\[
\mathbf{v} = \frac{\partial R}{\partial y} \mathbf{r} + \frac{\partial G}{\partial y} \mathbf{g} + \frac{\partial B}{\partial y} \mathbf{b}
\]
Color Edge Detection (2)

\[ g_{xx} = u \square u = \left| \frac{\partial R}{\partial x} \right|^2 + \left| \frac{\partial G}{\partial x} \right|^2 + \left| \frac{\partial B}{\partial x} \right|^2 \]

\[ g_{yy} = v \square v = \left| \frac{\partial R}{\partial y} \right|^2 + \left| \frac{\partial G}{\partial y} \right|^2 + \left| \frac{\partial B}{\partial y} \right|^2 \]

and

\[ g_{xy} = u \square v = \frac{\partial R}{\partial x} \frac{\partial R}{\partial y} + \frac{\partial G}{\partial x} \frac{\partial G}{\partial y} + \frac{\partial B}{\partial x} \frac{\partial B}{\partial y} \]
The direction of maximum rate of change of \( c(x, y) \) is given by the angle

\[
\theta(x, y) = \frac{1}{2} \tan^{-1} \left[ \frac{2g_{xy}}{g_{xx} - g_{yy}} \right]
\]

The value of the rate of change at \((x, y)\) in the direction of \(\theta(x, y)\), is given by

\[
F_\theta(x, y) = \left\{ \frac{1}{2} \left[ (g_{xx} + g_{yy}) + (g_{xx} - g_{yy}) \cos 2\theta(x, y) + 2g_{xy} \sin 2\theta(x, y) \right] \right\}^{1/2}
\]
FIGURE 6.46
