

# Principles of MRI

EE225E / BIO265

Lecture 18

Instructor: Miki Lustig  
UC Berkeley, EECS

M. Lustig, EECS UC Berkeley

1

## IMAGE CONTRAST

SO FAR ASSUMED

$$\vec{M}(0) = [0, 0, M_0]^T$$

SAMPLE IS FULLY RELAXED  $T_0 \gg T_1$ ,  
IN PRACTICE THIS IS SELDOM TRUE

$$I(x,y) = f(p, T_1, T_2, \underbrace{\omega, TR, TE}_{\text{PHYSICAL PARAMETERS}}, \underbrace{\rho, \sigma}_{\text{INSTRUMENTAL PARAMETERS}})$$

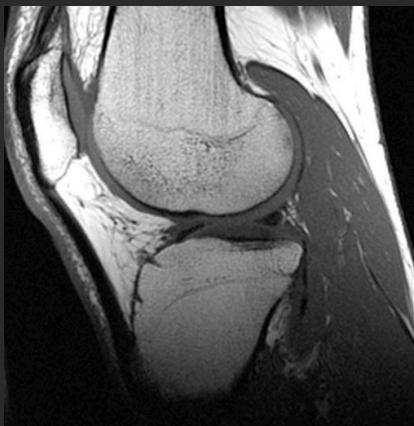

TISSUE HAS INNERN VARIABILITY IN  $T_1, T_2, f$ ,  
WHAT TO EMPHASIZE IT

M. Lustig, EECS UC Berkeley

2

## Question

- What is the difference between the images?

M. Lustig, EECS UC Berkeley

3

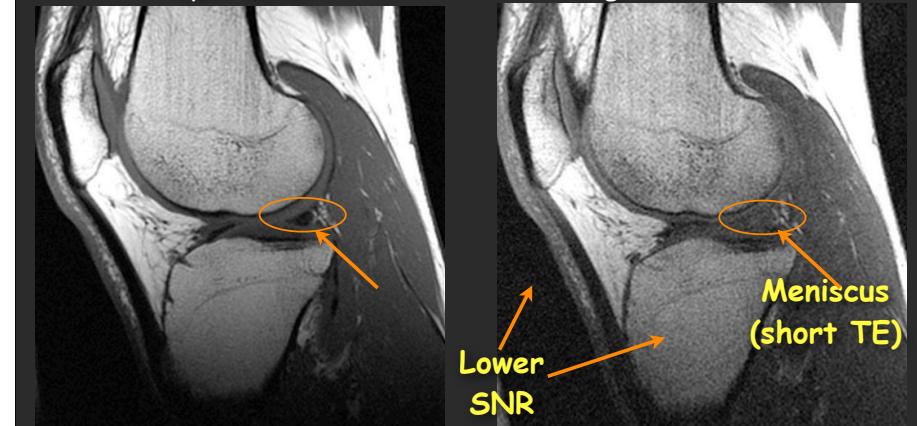

## Answer

- Both T1-weighted

spin-echo

gradient-echo

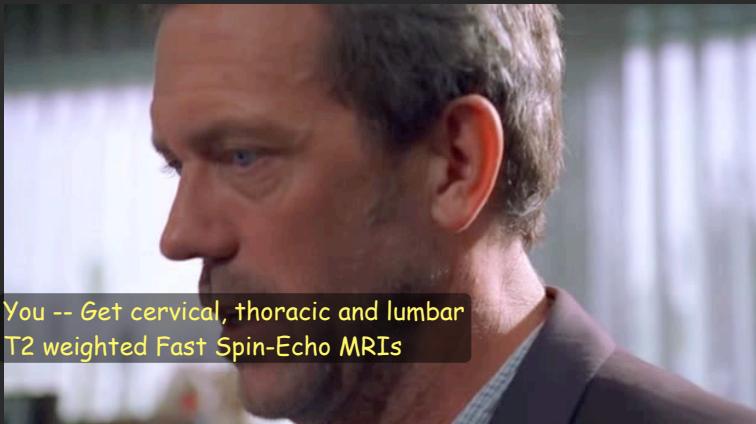

M. Lustig, EECS UC Berkeley

4

## Spin-Echo Properties

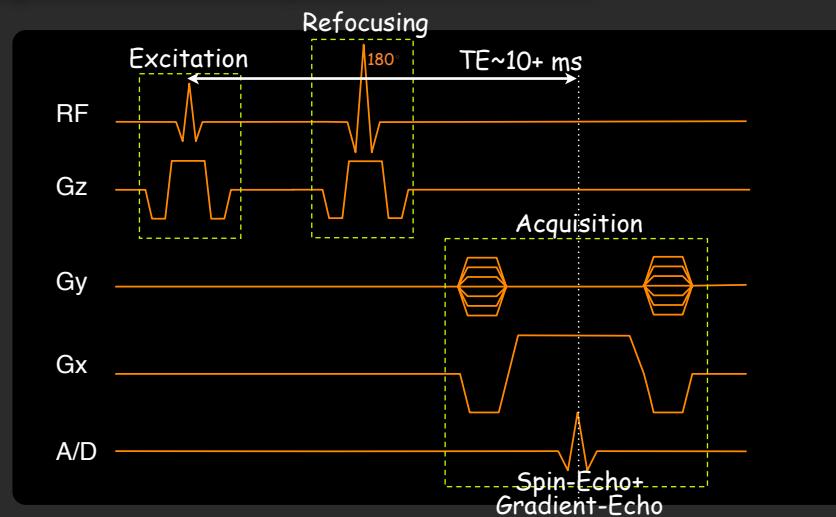

- Robust to off-resonance effects
- Excellent Contrast

M. Lustig, EECS UC Berkeley

5

## Spin-Echo Pulse Sequence

M. Lustig, EECS UC Berkeley

7

## Spin-Echo Properties

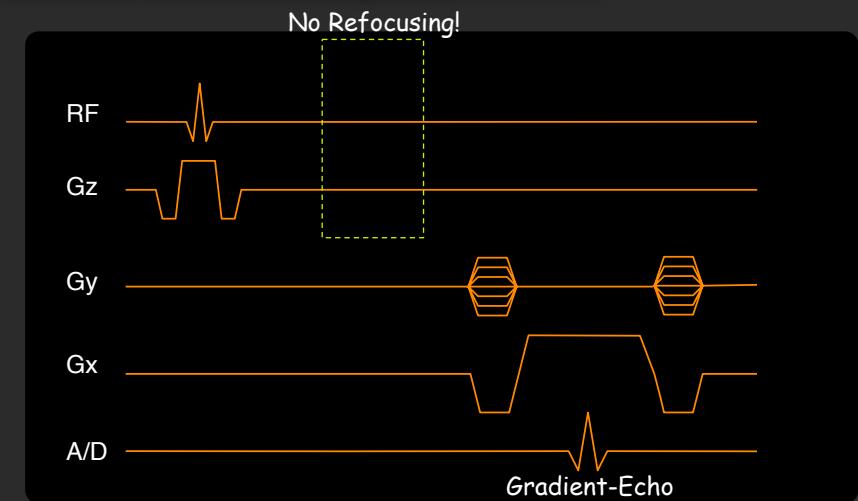

- Robust to off-resonance effects
- Excellent Contrast
- but...
- SAR limitations (high-power RF)
- Long scan times, and long echo-time
- Mostly multi-slice 2D
- Artifacts/long scan-time in 3D

Gradient-echo: Fast, short TE, often 3D

M. Lustig, EECS UC Berkeley

6

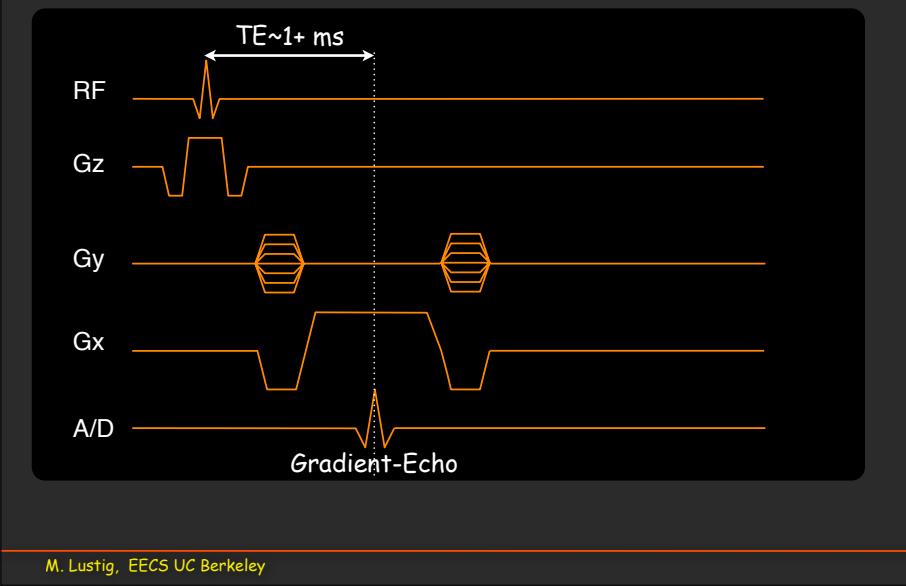

## Gradient-Echo Pulse Sequence

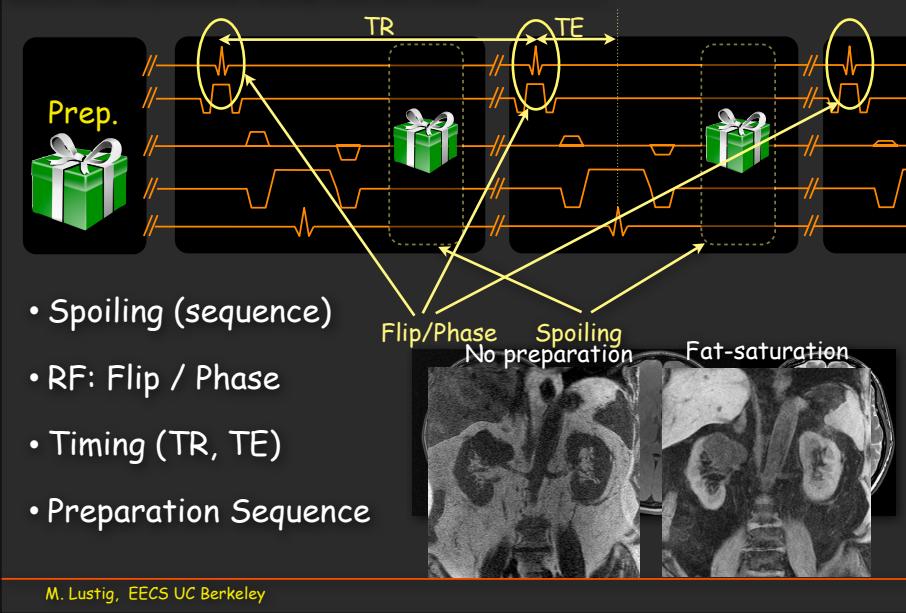

M. Lustig, EECS UC Berkeley

8

## Gradient-Echo Pulse Sequence

## Contrast Knobs: GRE Variations

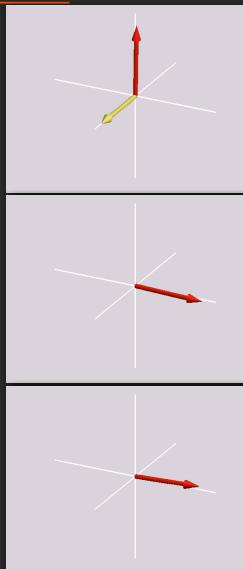

## Assumptions

- $m(x,y,t)$  is a function of time
- Approximation:
  - when analyzing  $I(x,y)$ , assume  $m(x,y,t=TE)$
- Consider:
  - $T1 > TR > 3T2$
  - Later :  $TR < 3T2$

## Review Magnetization Dynamics

- RF Excitation

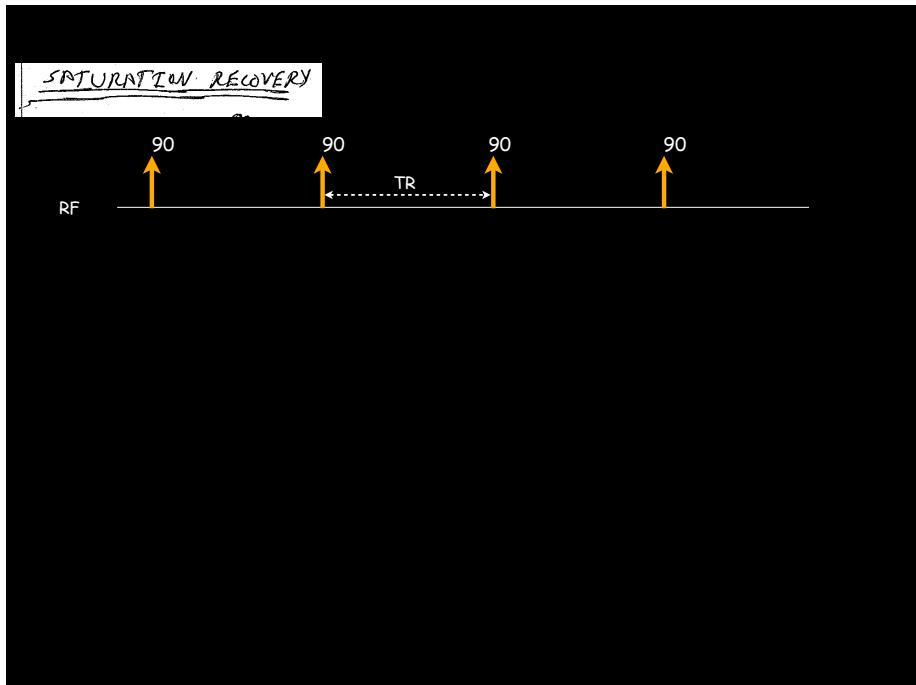

- Free-precession/  
(gradient induced)

- Relaxation

M. Lustig, EECS UC Berkeley

13

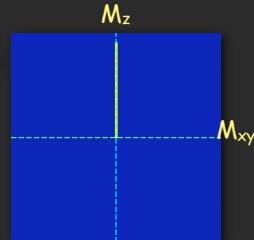

14

### Very Long TR: Full Relaxation

$TR \gg T_1$

- $M_{xy}$  decays completely before next RF
- $M_z$  recovers fully before next RF
- Full signal after RF

M. Lustig, EECS UC Berkeley

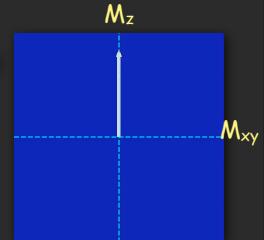

15

### Long TR: T1-Weighting

$TR \sim T_1 \gg T_2$

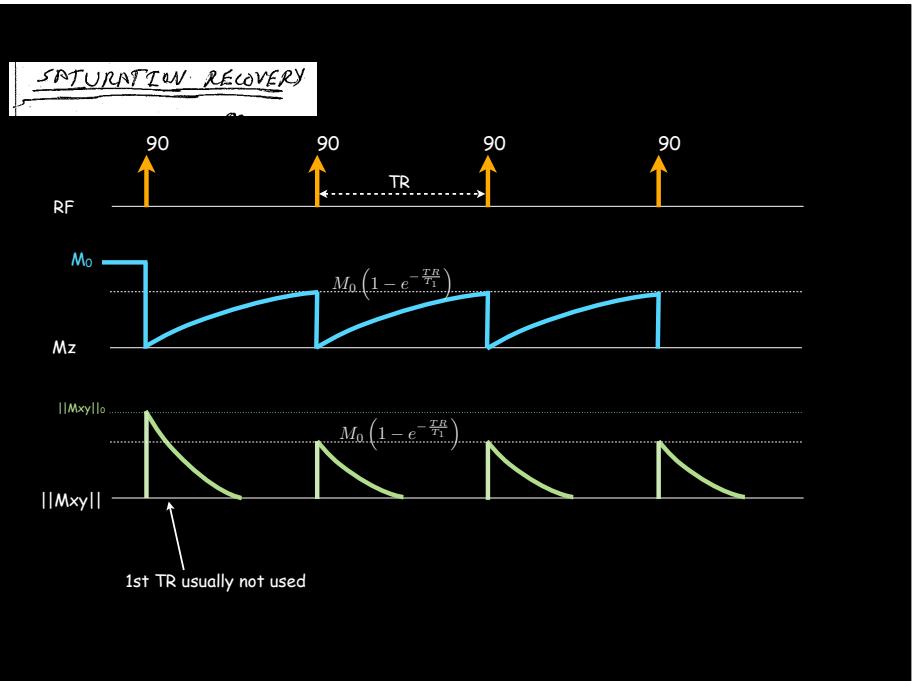

- $M_{xy}$  decays completely before next RF
- $M_z$  partially recovers before next RF
- T1-weighted signal after RF

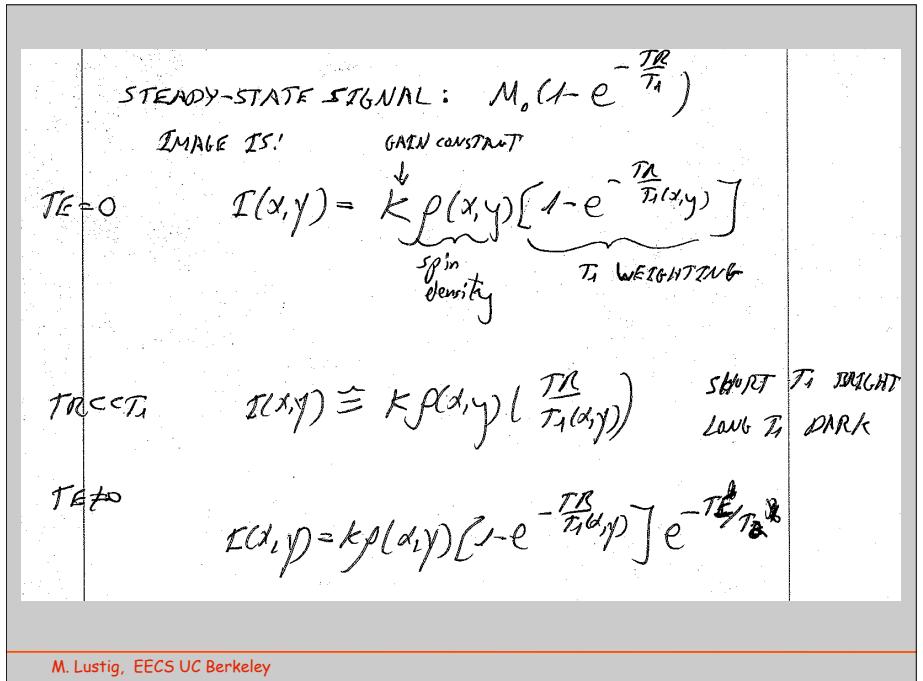

M. Lustig, EECS UC Berkeley

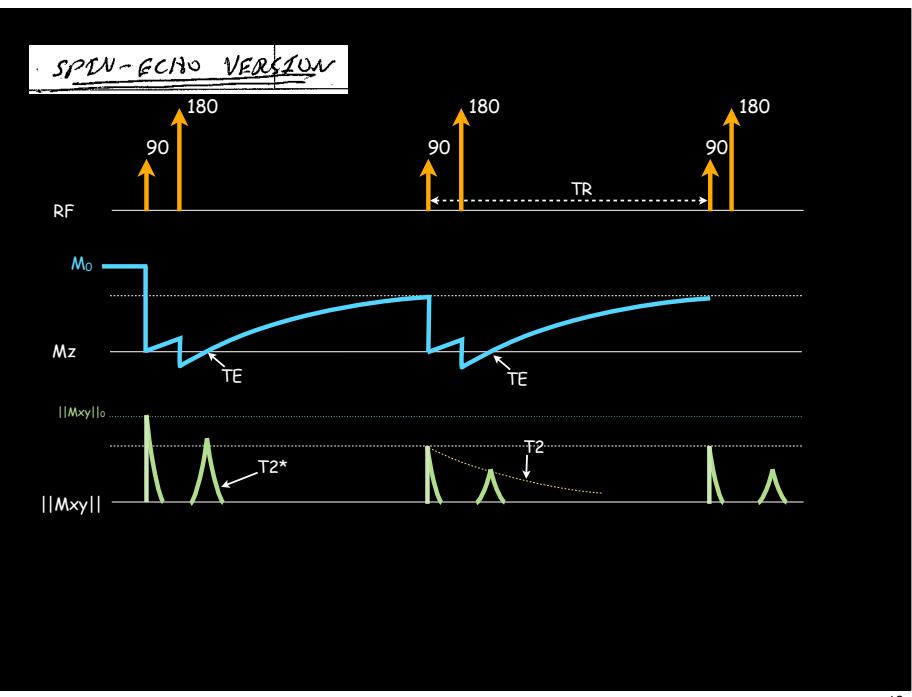

16

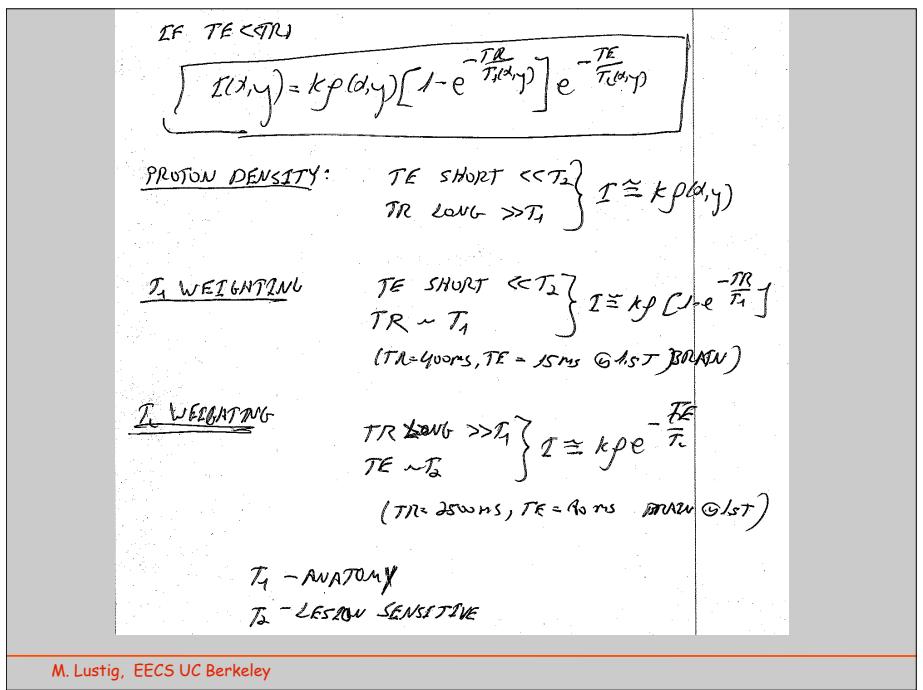

17

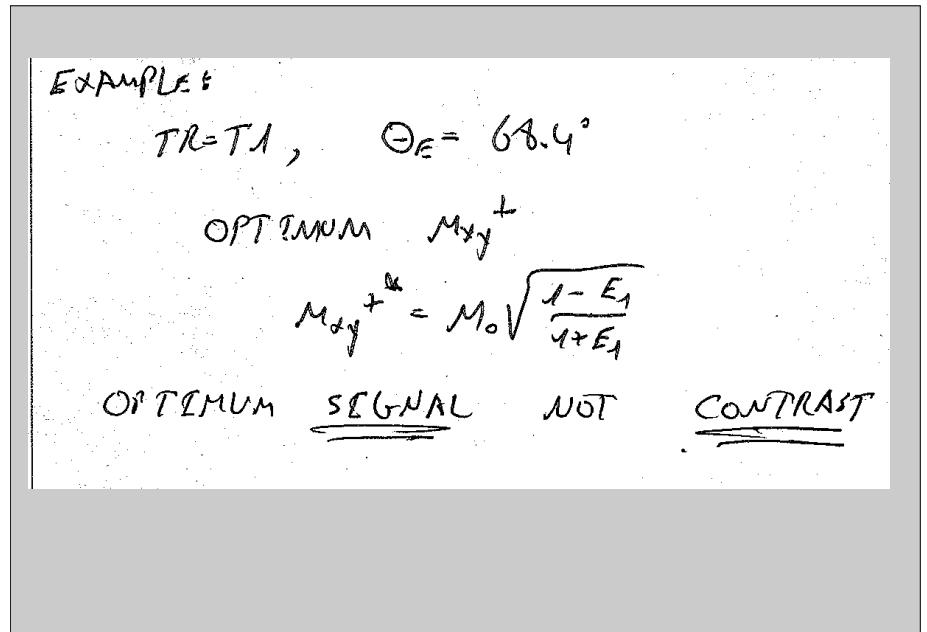

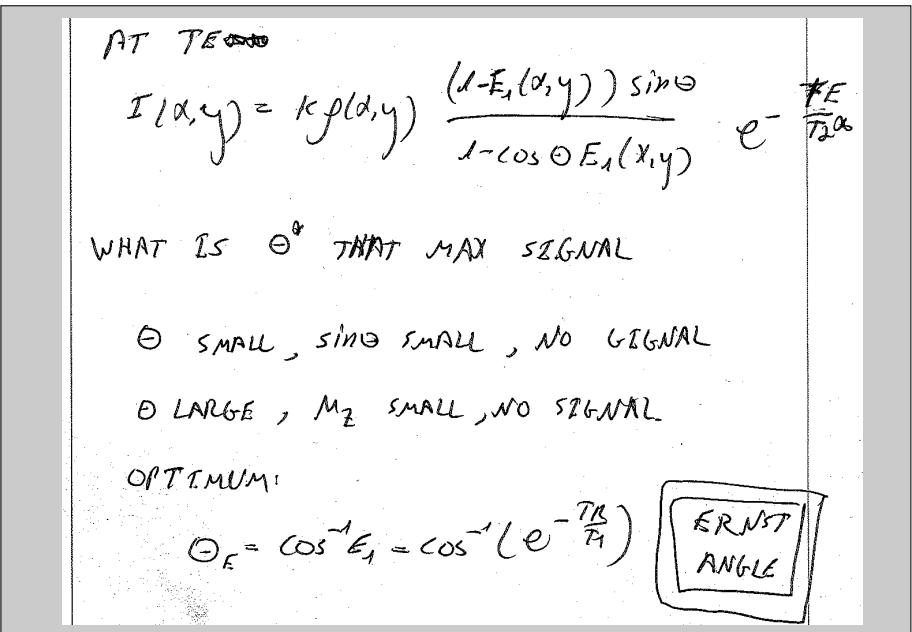

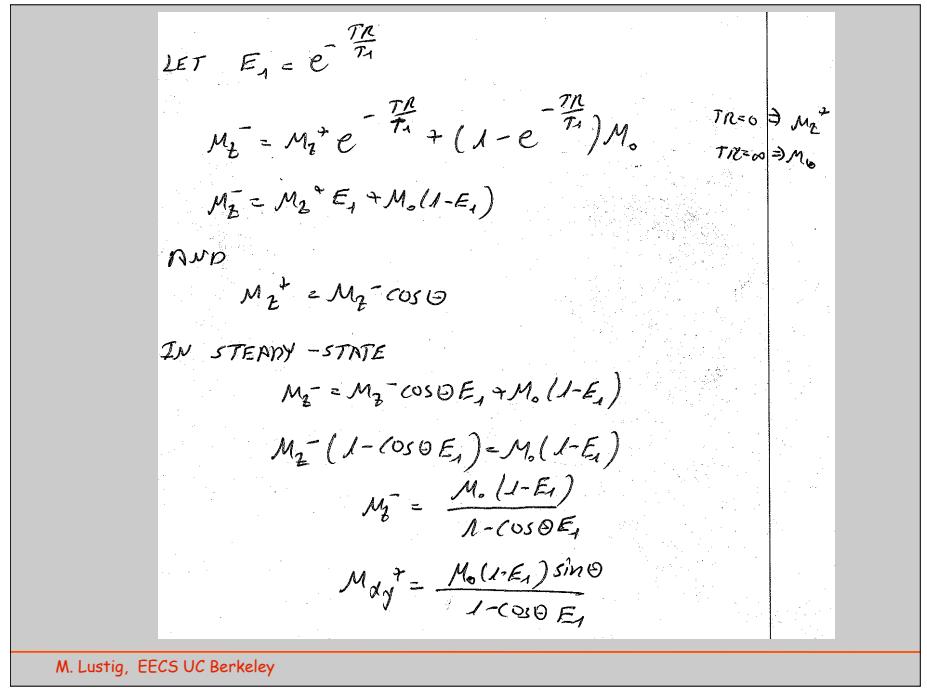

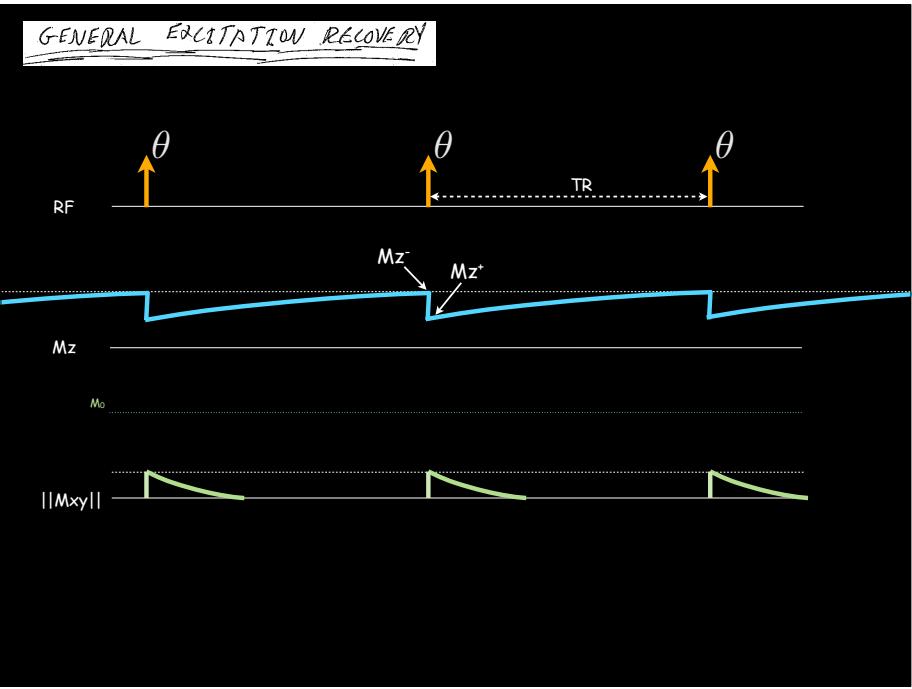

18

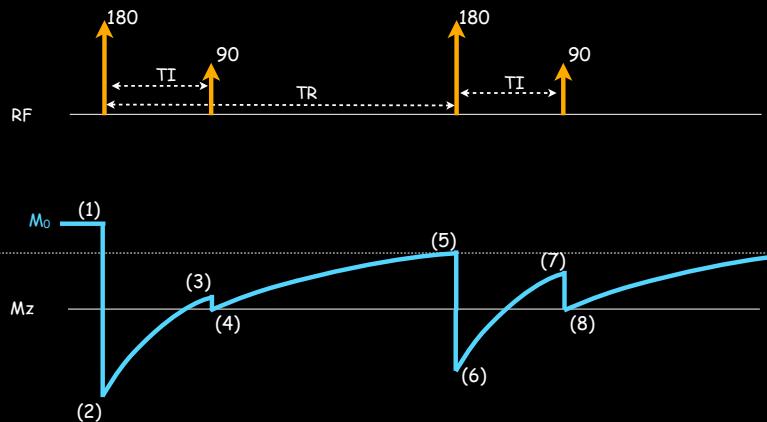

19

20

### INVERSION RECOVERY

25

AFTER 90°,  $M_2 = 0$

$$\text{AT } ⑤ \quad M_2 = \left(1 - e^{-\frac{(TR-TI)}{\tau_1}}\right) M_0$$

AT ⑥

$$M_2 = -M_0 \left(1 - e^{-\frac{(TR-TI)}{\tau_1}}\right)$$

AT ⑦

$$\begin{aligned} M_2 &= -M_0 \left(1 - e^{-\frac{(TR-TI)}{\tau_1}}\right) e^{-\frac{TI}{\tau_1}} + \\ &\quad + \left(1 - e^{-\frac{TI}{\tau_1}}\right) M_0 = \\ &= -M_0 e^{-\frac{TI}{\tau_1}} + M_0 e^{-\frac{TR}{\tau_1}} + M_0 + M_0 e^{-\frac{TI}{\tau_1}} \\ M_2 &= M_0 \left(1 + 2e^{\frac{-TI}{\tau_1}} + e^{-\frac{TR}{\tau_1}}\right) \end{aligned}$$

M. Lustig, EECS UC Berkeley

26

IMAGE IS @ TE

$$I(x,y) = k p(x,y) \left[ 1 - 2e^{-\frac{TE}{T_1(x,y)}} + e^{-\frac{TR}{T_1(x,y)}} \right] e^{-\frac{TE}{T_2(x,y)}}$$

IR GIVES

⇒ GREATER  $T_1$ , CONTRAST (ALMOST TWICE)

⇒ NULL SPECIFIC TISSUE

FAT ⇒ STIR  $T_1 \sim 150$  ms

CSF ⇒ FLAIR  $T_1 = 2000$  ms

NULL TIME:

$$1 - 2e^{-\frac{TI}{T_1}} + e^{-\frac{TR}{T_1}} = 0$$

$$TI = -T_1 \log \left[ \frac{1 + e^{-\frac{TR}{T_1}}}{2} \right]$$

$TR \gg T_1$

$$TI \approx -T_1 \log \frac{1}{2} = 0.693 T_1$$

M. Lustig, EECS UC Berkeley

27

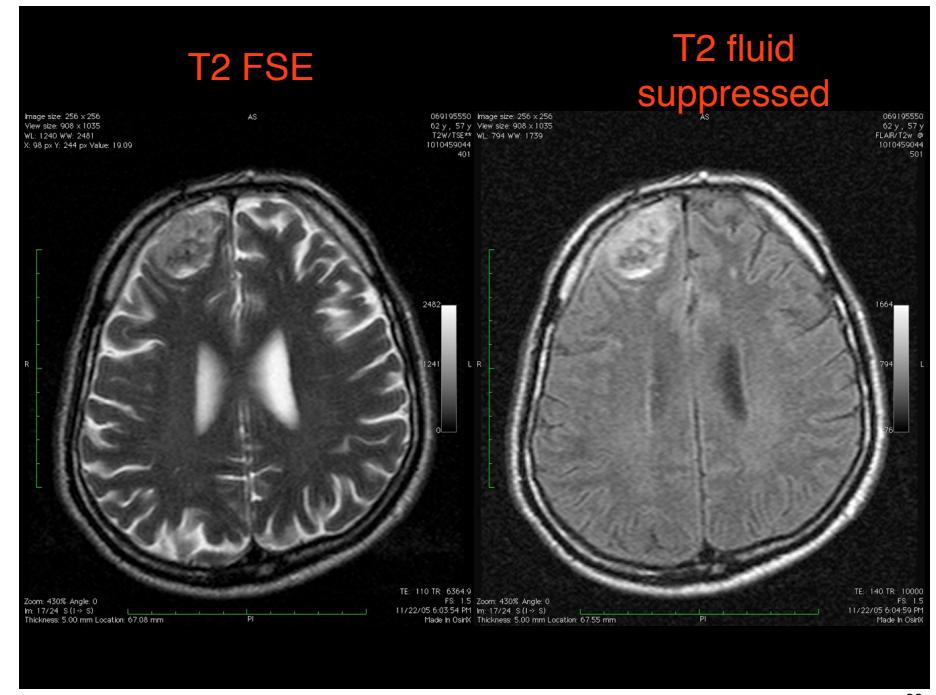

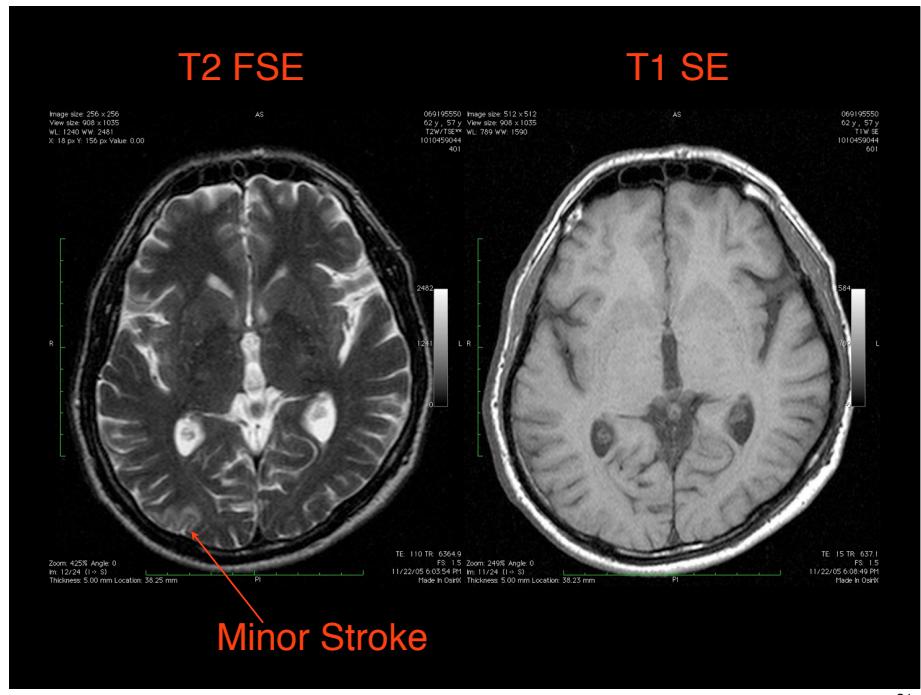

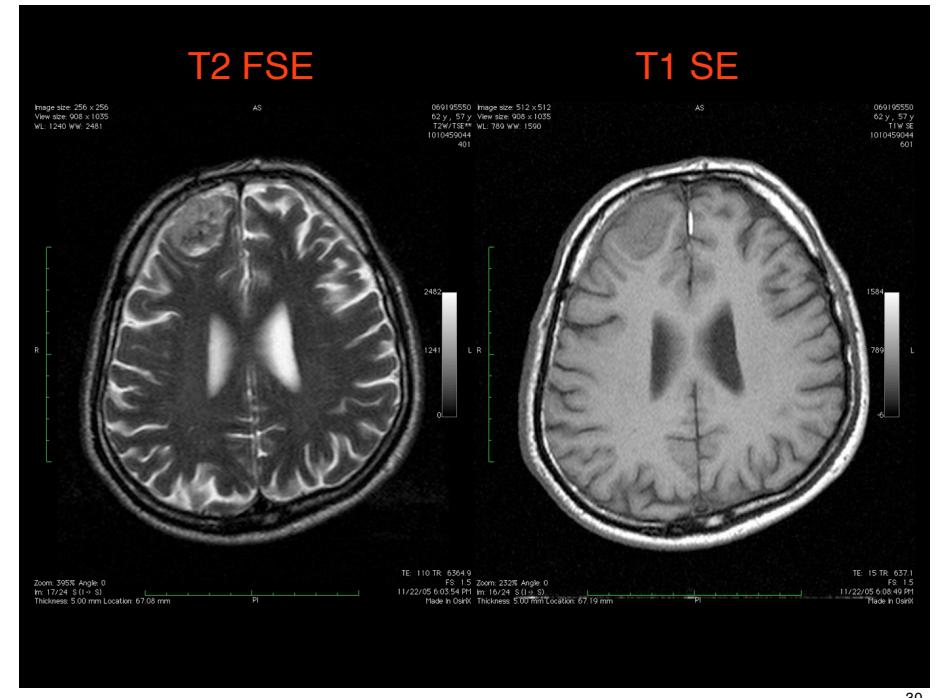

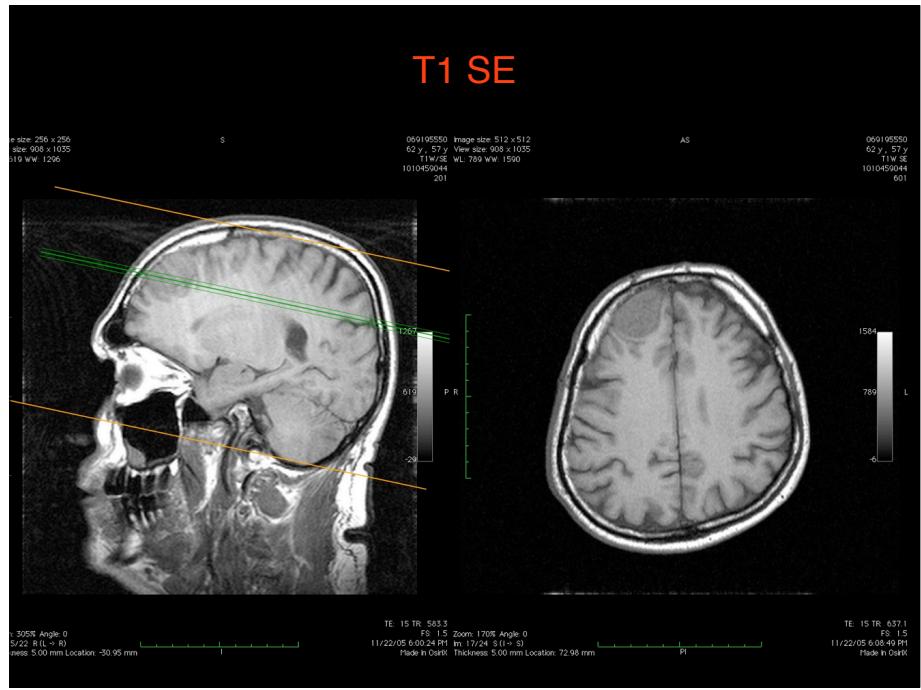

EXAMPLE: FAT NULLING

$T_1$  OF FAT  $\sim 260$  ms,  $TR = 900$

$$TI = -260 \log \left( \frac{1 + e^{-\frac{900}{260}}}{2} \right) \approx 168 \text{ ms}$$

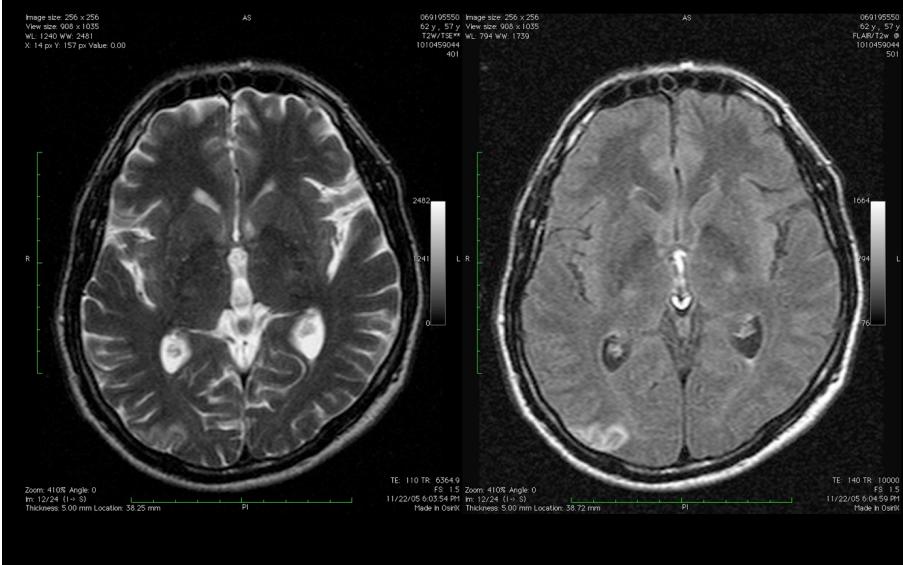

M. Lustig, EECS UC Berkeley

28

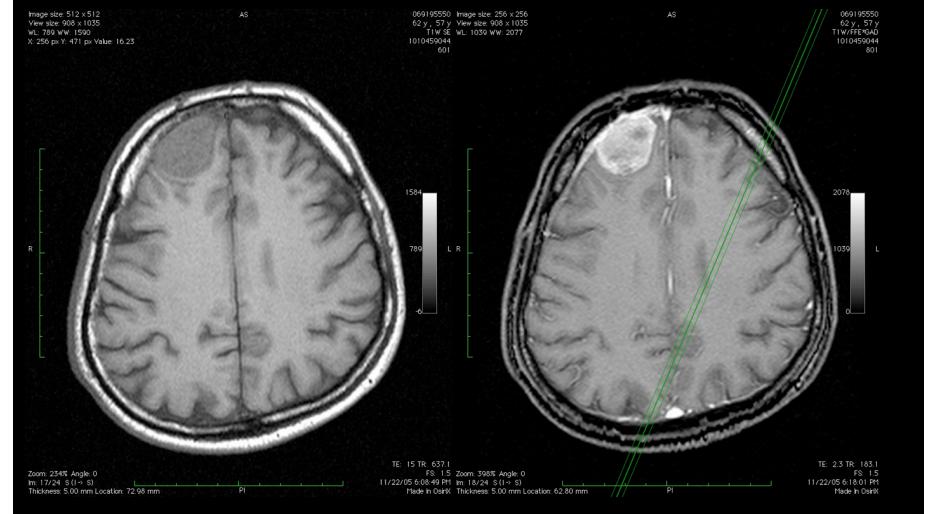

## T2 FSE

fluid suppressed

## T1 SE

## T1 FGRE + Contrast

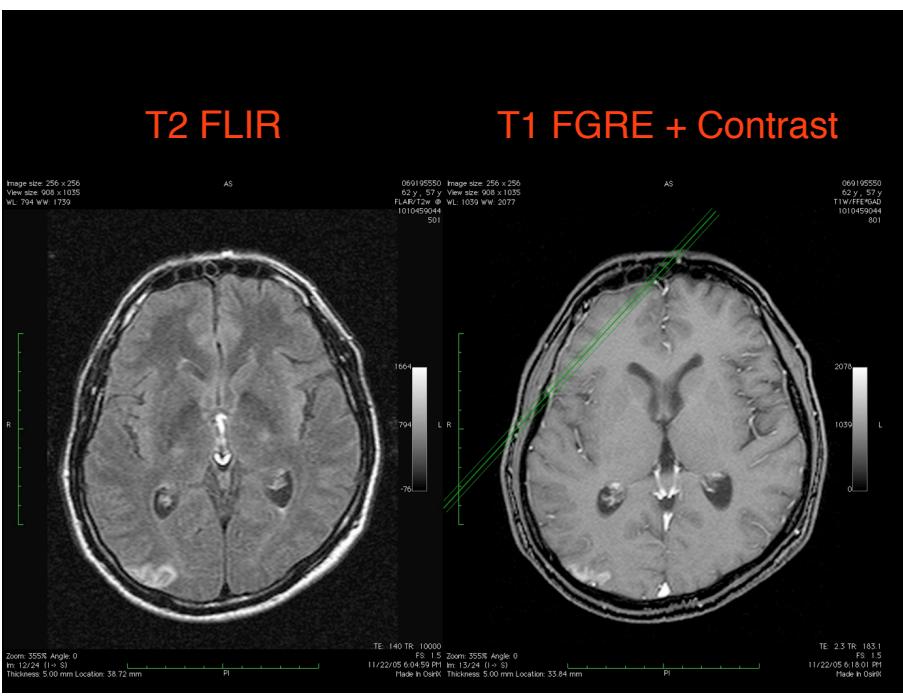

33

34

## T2 FLIR

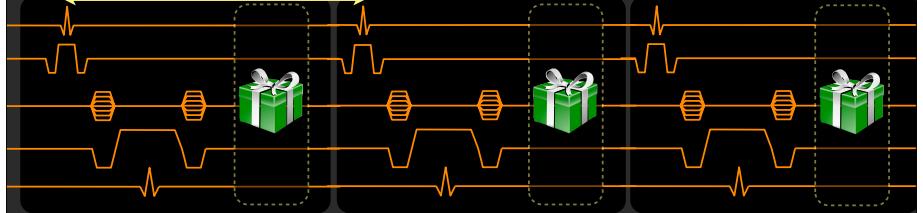

T1 FGRE + Contrast

35

## Short TR Steady-State Imaging

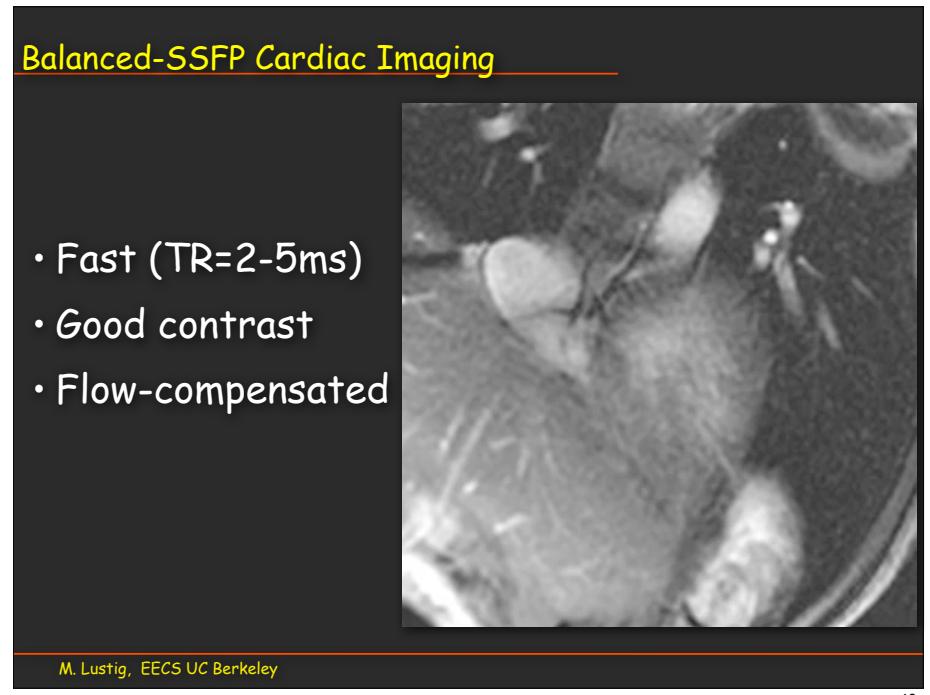

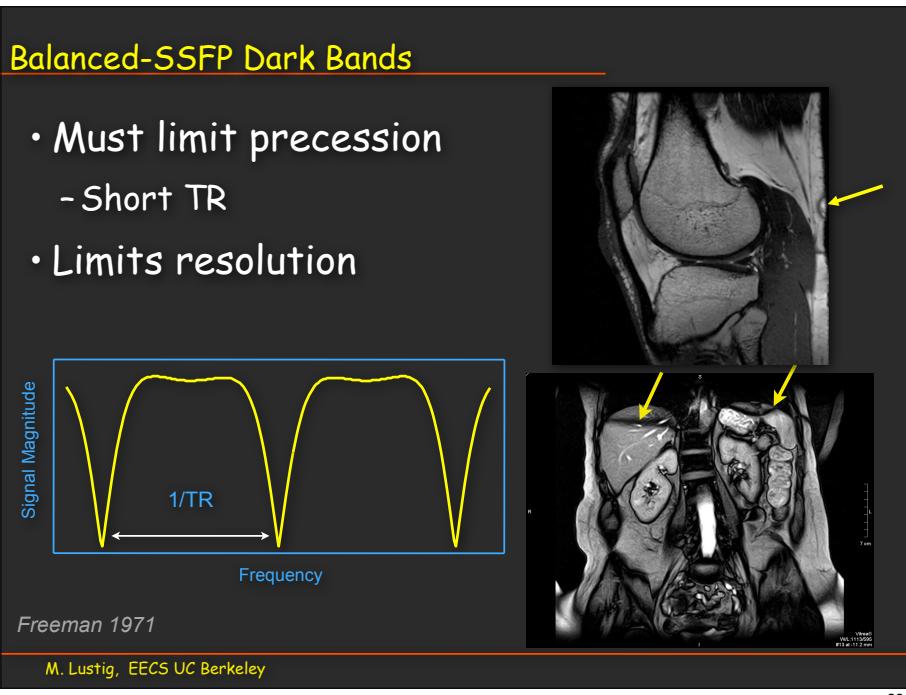

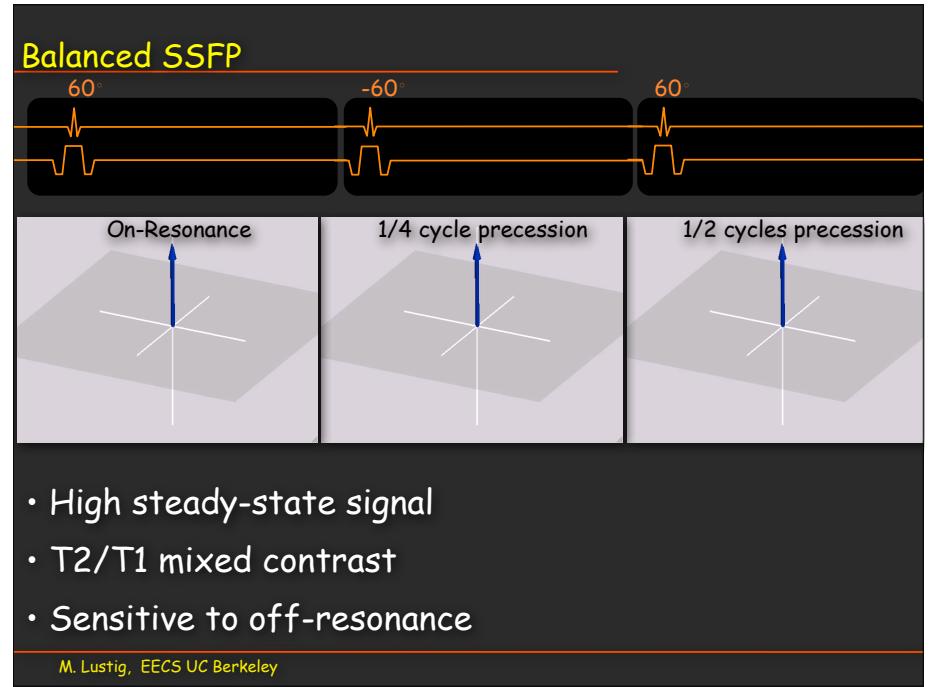

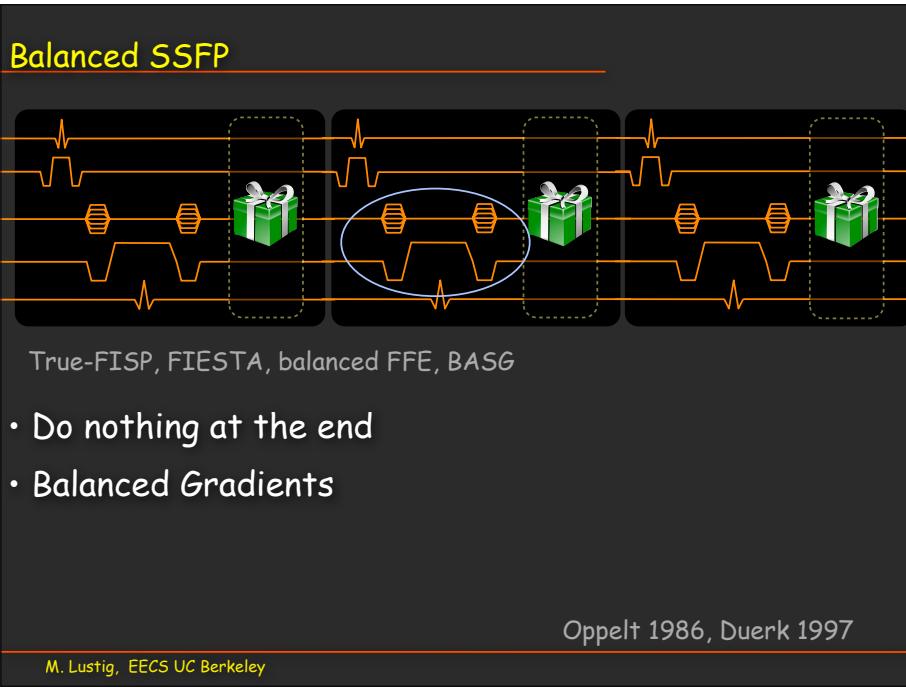

$TR \ll T1, T2$

- M<sub>xy</sub> persists before next RF
- May have shifted in phase
- Adds/Subtracts from next signal
- makes a HUGE difference on image contrast

M. Lustig, EECS UC Berkeley

36

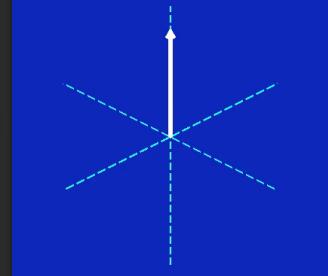

## Gradient Spoiling

FFE, FISP, GRASS, GRE, FAST, Field Echo

Spin distribution across slice

- Reduce sensitivity to off-resonance by Spoiling  $M_{xy}$  before next RF

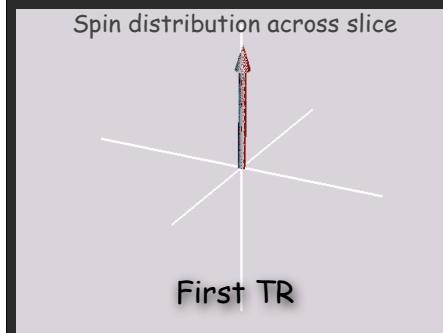

M. Lustig, EECS UC Berkeley

41

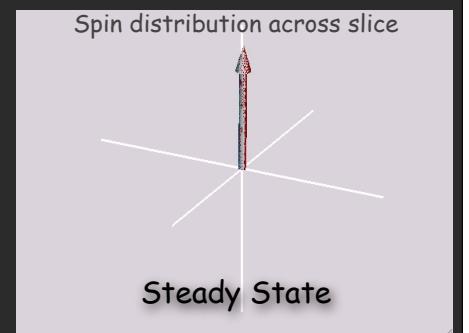

## Question

- Does gradient spoiling eliminates transverse signal at the end of TR?

M. Lustig, EECS UC Berkeley

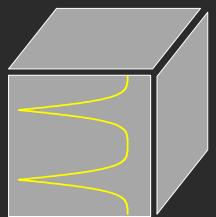

Steady State

42

## Answer

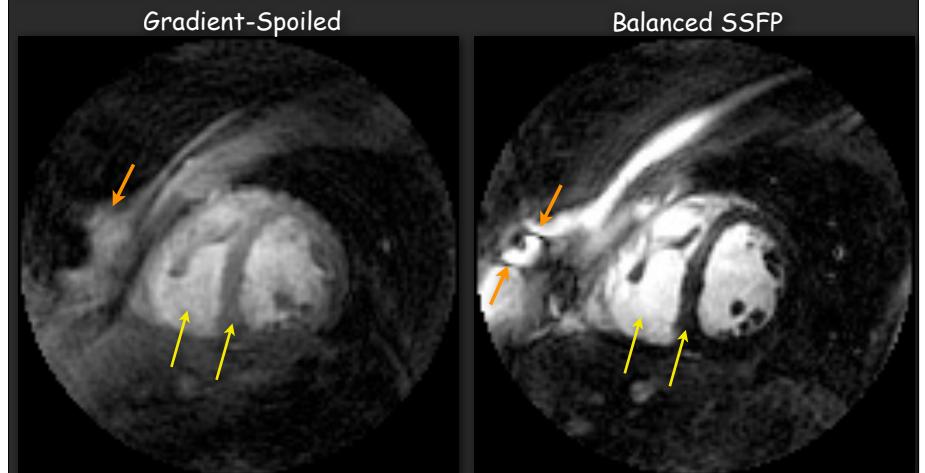

- No, its an average of balanced-SSFP but....
- No dark bands
- Lower signal than balanced-SSFP
- Reduced contrast

M. Lustig, EECS UC Berkeley

43

## Gradient Spoiled vs Balanced SSFP

(Courtesy of Krishna Nayak, USC Electrical Engineering)

M. Lustig, EECS UC Berkeley

44

## RF Spoiled Imaging

- Goal: Pure T1 contrast with short TR
- Fast, 3D T1-Weighted imaging
- Need to "Zero"  $M_{xy}$  at the end of TR

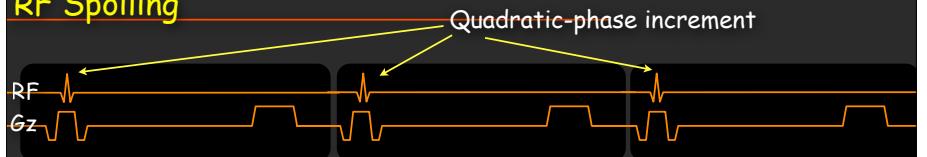

SPGR, FLASH, T1-FFE, RF-spoiled FAST

Frahm 1987, Zur 1991

M. Lustig, EECS UC Berkeley

45

## RF Spoiling

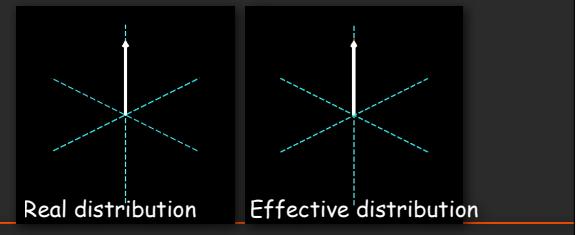

- The Trick:

- Quadratic Phase Increment of RF
- Effectively "Random" angle RF every TR
- Spoiled magnetization has random phase and does not add

- Low SNR!

M. Lustig, EECS UC Berkeley

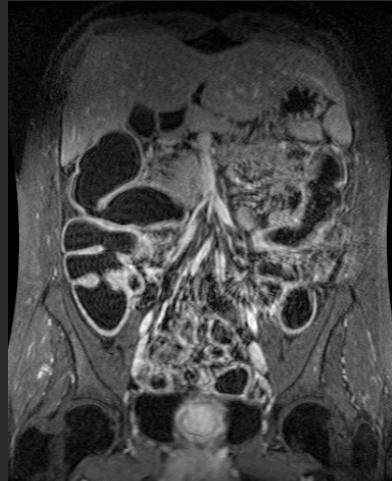

46

## RF Spoiled Contrast Enhanced MR

Pre-Contrast SPGR

Post-Contrast SPGR

M. Lustig, EECS UC Berkeley

47

## RF Spoiled Dynamic Contrast MR

Enhancement over Time

Repeated 6-second breath holds, 10 seconds apart  
32 slices using 3x accelerated imaging

M. Lustig, EECS UC Berkeley

48

M. Lustig, EECS UC Berkeley

49

Gradient Echo Sequence Comparison			
Sequence	Balanced SSFP	Gradient Echo	RF-Spoiled
Spoiling	None	Gradient	RF + Gradient
Transverse Magnetization	Retained	Averaged	Cancelled
Contrast	$T_2/T_1$	$T_2/T_1$	$T_1$
SNR	High (but Banding)	Moderate	Lower

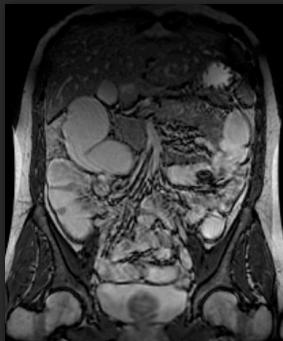

M. Lustig, EECS UC Berkeley

50

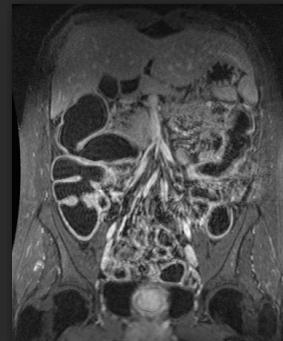

### Quiz I

Here are a balanced SSFP and RF-Spoiled post-contrast image. Which is the image on the left?

- 1) RF-Spoiled Post Gd
- 2) Balanced SSFP

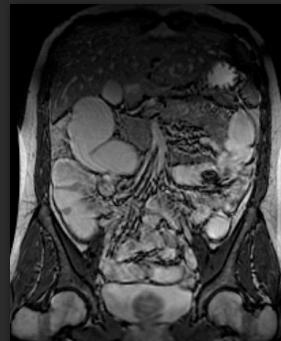

M. Lustig, EECS UC Berkeley

51

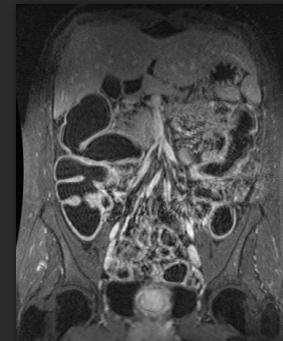

### Quiz I

- 2) Balanced SSFP Bright Fluid (T2-like)

M. Lustig, EECS UC Berkeley

- 1) RF Spoiled post Gd T1 contrast, enhanced wall

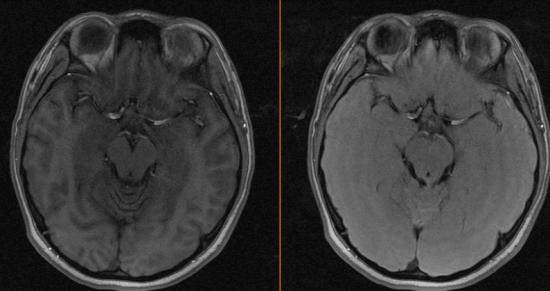

52

## Image Comparison

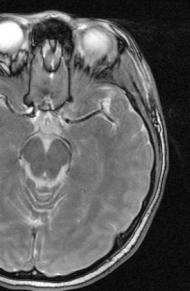

Identify the images shown (Same TR, TE, Flip)

1) RF Spoiled	Balanced SSFP	Gradient Spoiled
2) Gradient Spoiled	RF Spoiled	Balanced SSFP
3) RF Spoiled	Gradient Spoiled	Balanced SSFP

M. Lustig, EECS UC Berkeley

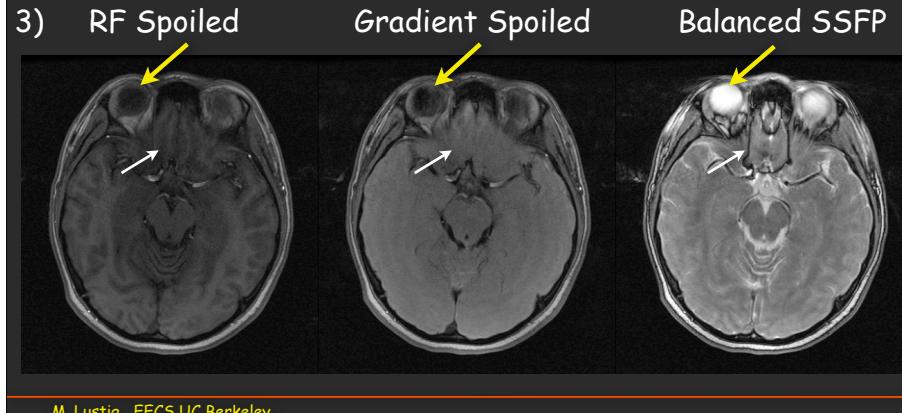

53

M. Lustig, EECS UC Berkeley

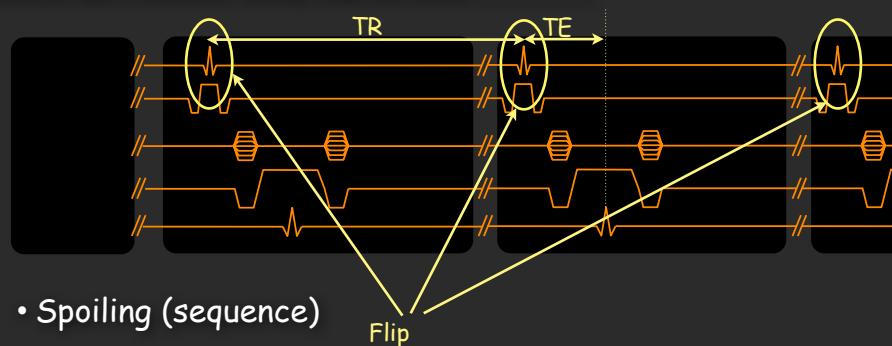

## Image Comparison

- Same TR, TE, flip angle
- Differences: Signal, Contrast, Dark-Bands

54

## Contrast Knobs: GRE Variations

- Spoiling (sequence)
- RF: Flip
- Timing (TR, TE)
- Preparation Sequence

M. Lustig, EECS UC Berkeley

55

## Flip Angle in Gradient Echo Sequences

Does increasing the flip angle increase signal?

- 1) Yes: Signal always increases with flip angle.
- 2) No: Signal decreases as flip angle increases
- 3) Sometimes: The signal peaks at a specific flip angle

M. Lustig, EECS UC Berkeley

56

## Flip Angle in Gradient Echo Sequences

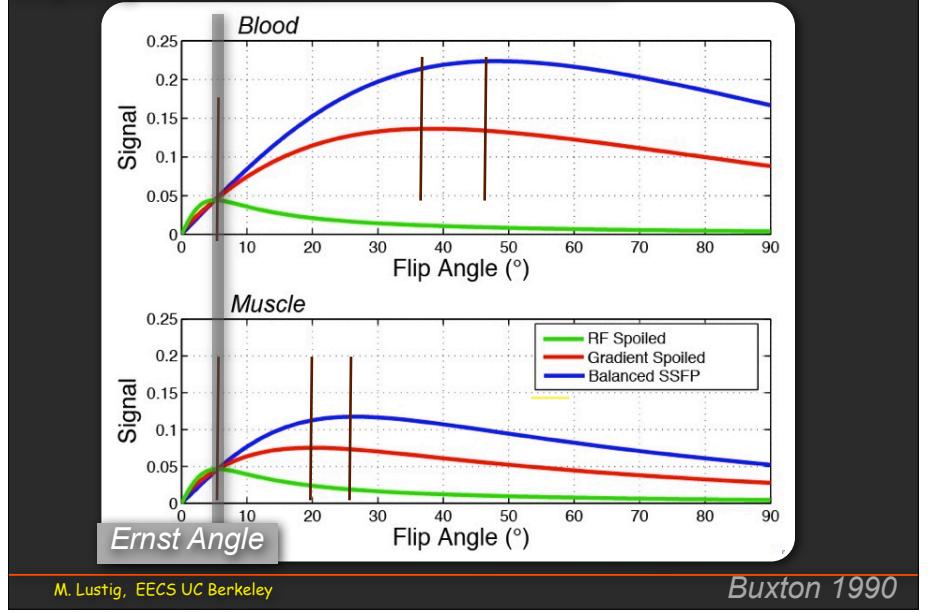

Does increasing the flip angle increase signal?

- 1) Yes: Signal always increases with flip angle.
- 2) No: Signal decreases as flip angle increases
- 3) Sometimes: The signal peaks at a specific flip angle

M. Lustig, EECS UC Berkeley

57

## Flip Angle Selection

M. Lustig, EECS UC Berkeley

Buxton 1990

58

## Flip Angle Selection?

The best flip angle to use is found by:

- 1) Maximizing the image SNR
- 2) Maximizing contrast between certain tissues
- 3) Both 1 and 2

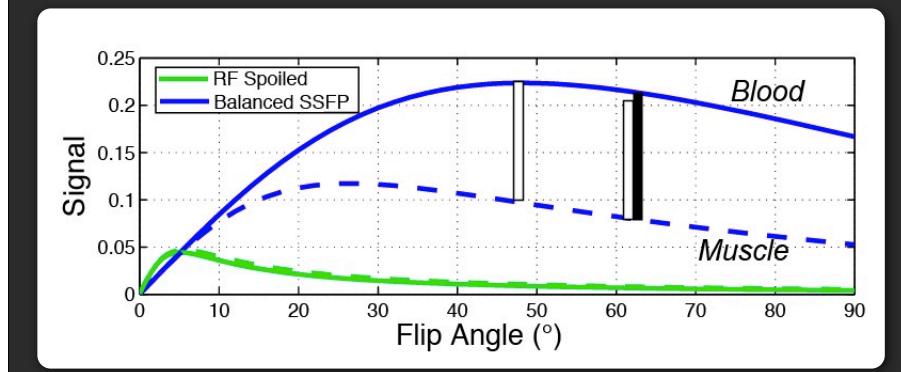

M. Lustig, EECS UC Berkeley

59

## Flip Angle Selection?

The best flip angle to use is found by:

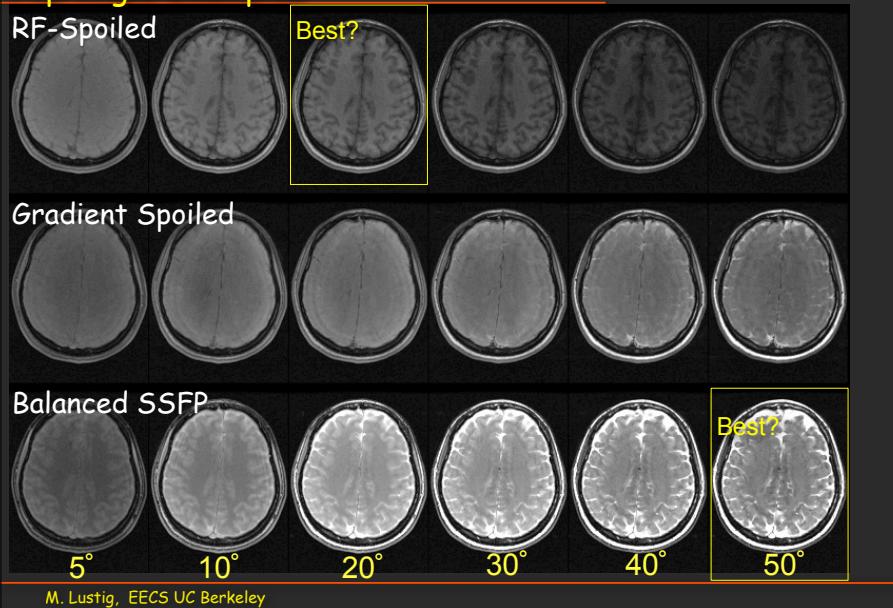

- 3) Both 1 and 2: maximizing SNR and contrast (CNR)

M. Lustig, EECS UC Berkeley

60

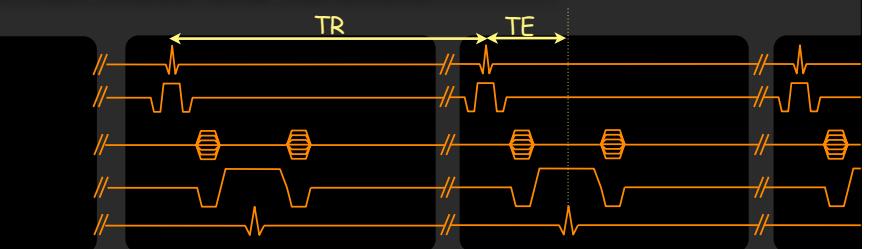

## Flip Angle Examples

M. Lustig, EECS UC Berkeley

61

## Contrast Knobs: GRE Variations

- Spoiling (sequence)

- RF: Flip / Phase

- Timing (TR, TE)

- Preparation Sequence

M. Lustig, EECS UC Berkeley

62

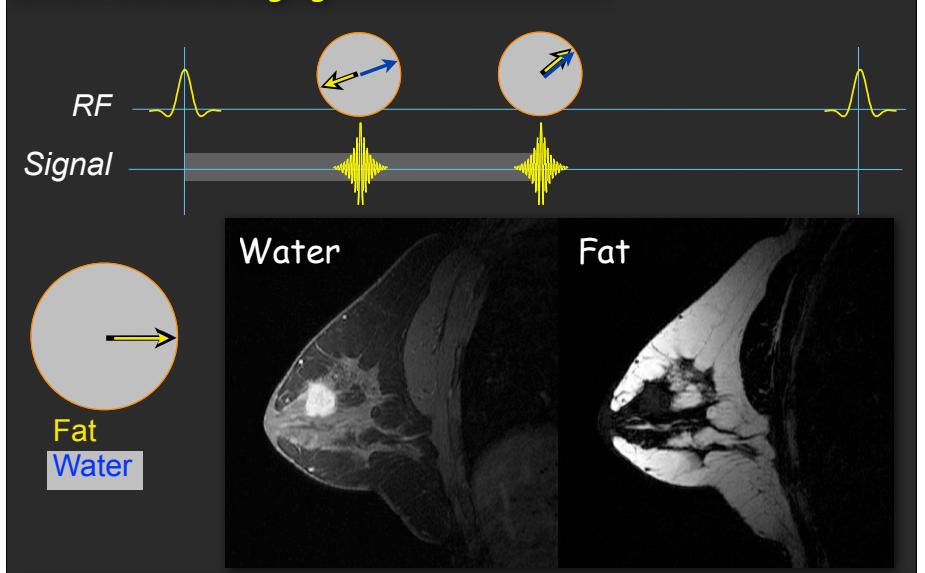

## Echo Time (TE) Considerations

- Longer TE: T2\* weighting (BOLD, Perfusion)
  - BOLD Imaging for fMRI
  - T2\*-weighted perfusion
- Short TE
  - Reduced flow/motion sensitivity
  - Reduced T2\* weighting
- In-phase and Out-of-phase TE
  - Water/Fat cancellation, Dixon Imaging

M. Lustig, EECS UC Berkeley

63

## Dixon-Based Imaging

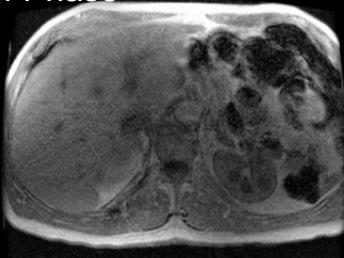

M. Lustig, EECS UC Berkeley

64

## Liver Imaging

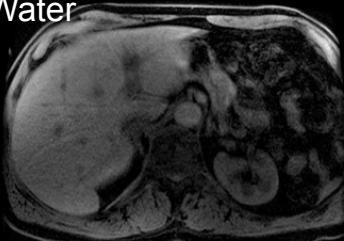

In-Phase

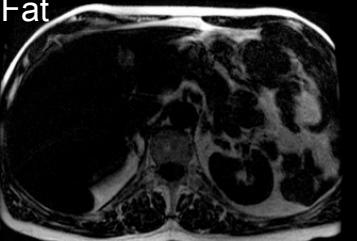

Out-of-Phase

Water

Fat

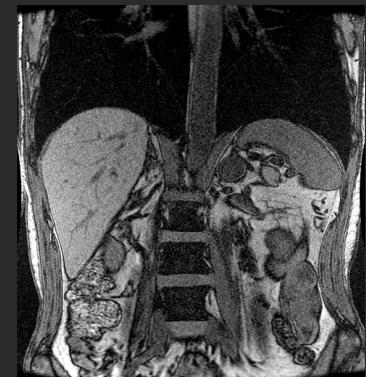

M. Lustig, EECS UC Berkeley

65

## Question

Gradient spoiled images - which is opposed phase?

- 1) Left
- 2) Right

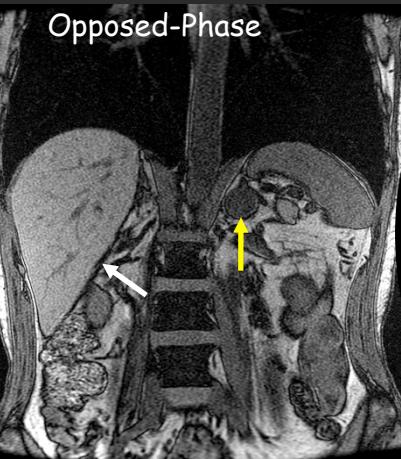

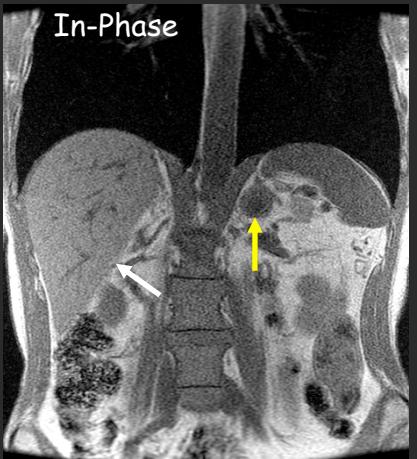

M. Lustig, EECS UC Berkeley

66

## Gradient Spoiling: TE Effects

2) Right

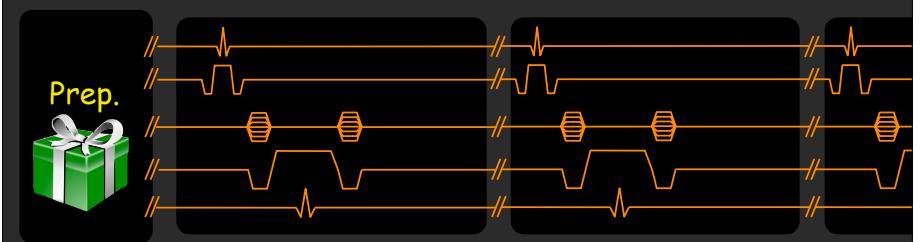

Left adrenal lesion with signal loss on opposed phase imaging -  
Diagnosis Benign Adenoma

M. Lustig, EECS UC Berkeley

67

## Contrast Knobs: GRE Variations

- Spoiling (sequence)
- RF: Flip / Phase
- Timing (TR, TE)
- Preparation Sequence

M. Lustig, EECS UC Berkeley

68

## Preparation Options

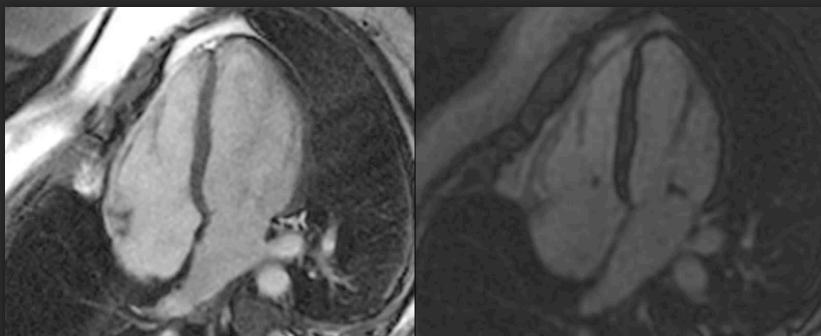

- Fat Saturation
- Inversion - Recovery
- Myocardial Tagging
- T2-prep
- Magnetization Transfer

M. Lustig, EECS UC Berkeley

69

## Cardiac: bSSFP and IR-RF-Spoiled

M. Lustig, EECS UC Berkeley

71

## Fat Saturation Example

Not Fat-Sat RF-Spoiled

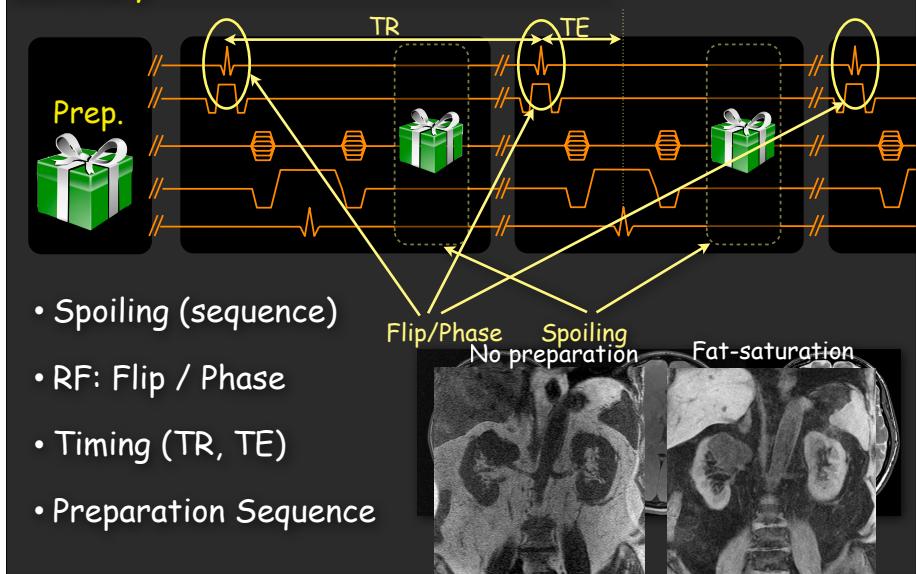

Fat Sat RF-Spoiled

M. Lustig, EECS UC Berkeley

70

## Summary

72

## Summary and Acronyms

- RF spoiled
  - SPGR, FLASH, T1-FFE, RF-spoiled FAST
- Balanced SSFP
  - True-FISP, FIESTA, balanced FFE, BASG
- Gradient spoiled
  - FFE, FISP, GRASS, GRE, FAST, Field Echo
- Vendor acronyms are confusing -- Demand that they tell you what it really is...!
- Acronym source: [mr-tip.com](http://mr-tip.com)

M. Lustig, EECS UC Berkeley
