Why Polysilicon?

- Compatible with IC fabrication processes
 - ↳ Process parameters for gate polysilicon well known
 - ↳ Only slight alterations needed to control stress for MEMS applications
- Stronger than stainless steel: fracture strength of polySi ~ 2-3 GPa, steel ~ 0.2GPa-1GPa
- Young's Modulus ~ 140-190 GPa
- Extremely flexible: maximum strain before fracture ~ 0.5%
- Does not fatigue readily
- Several variations of polysilicon used for MEMS
 - ↳ LPCVD polysilicon deposited undoped, then doped via ion implantation, PSG source, POCl_3 , or B-source doping
 - ↳ In situ-doped LPCVD polysilicon
 - ↳ Attempts made to use PECVD silicon, but quality not very good (yet) → etches too fast in HF, so release is difficult
