

EE C245 - ME C218
Introduction to MEMS Design
Fall 2009

Prof. Clark T.-C. Nguyen

Dept. of Electrical Engineering & Computer Sciences
University of California at Berkeley
Berkeley, CA 94720

Lecture Module 8: Microstructural Elements

EE_C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 1

Outline

- Reading: Senturia, Chpt. 9
- Lecture Topics:
 - ↗ Bending of beams
 - ↗ Cantilever beam under small deflections
 - ↗ Combining cantilevers in series and parallel
 - ↗ Folded suspensions
 - ↗ Design implications of residual stress and stress gradients

EE_C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 2

UC Berkeley

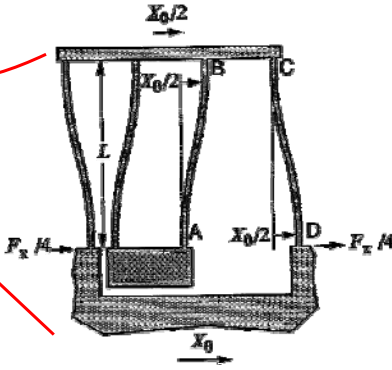

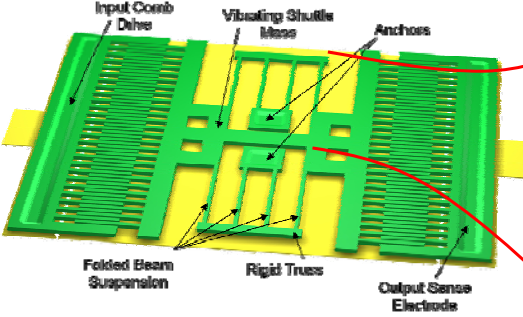

Bending of Beams

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 3

UC Berkeley

Beams: The Springs of Most MEMS

- Springs and suspensions very common in MEMS
 - ↪ Coils are popular in the macro-world; but not easy to make in the micro-world
 - ↪ Beams: simpler to fabricate and analyze; become “stronger” on the micro-scale → use beams for MEMS

Comb-Driven Folded Beam Actuator

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 4

UC Berkeley

Bending a Cantilever Beam

Clamped end condition:
At $x=0$:
 $y=0$
 $dy/dx = 0$

Free end condition

F

x'

L

x

- **Objective:** Find relation between tip deflection $y(x=L_c)$ and applied load F
- **Assumptions:**
 1. Tip deflection is small compared with beam length
 2. Plane sections (normal to beam's axis) remain plane and normal during bending, i.e., "pure bending"
 3. Shear stresses are negligible

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 5

UC Berkeley

Reaction Forces and Moments

Reaction $\left\{ \begin{array}{l} M_R = M_1 \\ F_R = F \end{array} \right.$

Point Load F

Moment due to F, here:
 $M_1 = FL$

Moment due to F, here:
 $M_2 = F(L-x)$

split

Reactions (Senturia gives expressions)

For equilibrium: $M_{x,r} = M_3 = F(L-x)$
 $V_{x,r} = F$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 6

Sign Conventions for Moments & Shear Forces

UC Berkeley

Moment

Positive: (+) moment leads to deformation with a (+) radius of curvature (i.e., upwards)

Negative: (-) moment leads to deformation with a (-) radius of curvature (i.e., downwards)

Shear

Positive: (+) shear forces produce clockwise rotation

Negative: (-) shear forces produce counter-clockwise rotation

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 7

Beam Segment in Pure Bending

UC Berkeley

Portions above the neutral axis go into tension

Portions below the neutral axis go into compression

Neutral Axis → Length unchanged by bending

Applied Moment M_o

Note: (+) direction of z is downward

Consider a segment bounded by the dashed lines defined by $d\theta$:

At $z=0$: (i.e., at the neutral axis): segment length = $dx = R d\theta$ (1)

At any z : segment length = $dL = (R - z) d\theta$ (2)

Combining (1) & (2): $dL = dx - z d\theta = dx - \frac{z}{R} dx$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 8

Beam Segment in Pure Bending (cont.)

UC Berkeley

Thus, the axial strain @ z : $\epsilon_x = \frac{dL - dx}{dx} = -\frac{z}{R} \Rightarrow \boxed{\epsilon_x = -\frac{z}{R}}$
 $\left[\begin{array}{l} dx = \text{Original (unstressed)} \\ \text{segment length} \end{array} \right] \rightarrow$

Thus, strain varies linearly along beam thickness, and has a maximum value
 $\epsilon_{x,max} = \frac{h/2}{R}$

Of course, there is a corresponding axial stress:
 $\sigma_x = \epsilon_x E = \boxed{-\frac{zE}{R} = \sigma_x}$

$\sigma_x = (+) \rightarrow$ tension
 $\sigma_x = (-) \rightarrow$ compression.

This gradient in stress then generates a bending moment... *in response to the applied moment!*

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 9

Internal Bending Moment

UC Berkeley

Moment around this point

Small section of a beam bent in response to a transverse load

Tension Neutral Axis Compression

M_o R $d\theta$ z

(+) radius of curvature Effectively, z = distance f/ the moment reference pt.

To get the bending moment:
 \Rightarrow integrate stress through the thickness of the beam

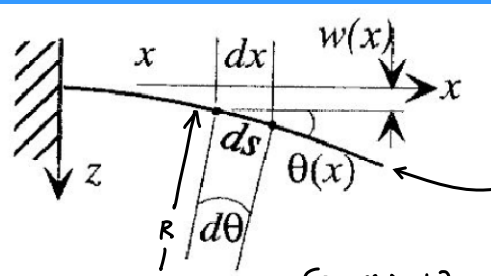

$M = \int_{-h/2}^{h/2} [(Wdz)\sigma_x] \cdot z = - \int_{-h/2}^{h/2} \frac{EWz^2}{R} dz \Rightarrow \boxed{M = -\left(\frac{1}{12}Wh^3\right) \frac{E}{R}}$

force $\left\{ \sigma_x = -\frac{zE}{R} \right\}$ $\frac{1}{12}Wh^3 = I \triangleq$ Moment of Inertia

$\boxed{\frac{1}{R} = -\frac{M}{EI}}$ Note: (+) radius of curvature
 \rightarrow (-) internal bending moment!

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 10

Differential Beam Bending Equation

Write out geometric relationships:

$$\cos\theta = \frac{dx}{ds} \rightarrow ds = \frac{dx}{\cos\theta} \xrightarrow{\text{Small Angle Approx.}} ds \approx dx$$

$$\tan\theta = \frac{dw}{dx} = \text{slope of beam @ any point} \rightarrow \theta \approx \frac{dw}{dx} \quad (1)$$

$$ds = R d\theta \rightarrow \frac{1}{R} = \frac{d\theta}{ds} \rightarrow \frac{1}{R} = \frac{d^2w}{dx^2} \quad (2)$$

Inserting (1) in (2): $\frac{1}{R} = \frac{d^2w}{dx^2} = -\frac{M}{EI}$ [Differential Equation for Small Angle Bending of Beams]

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 11

Example: Cantilever Beam w/ a Concentrated Load

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 12

Cantilever Beam w/ a Concentrated Load
UC Berkeley

Clamped end condition:
At $x=0$:
 $w=0$
 $dw/dx = 0$

Free end condition

Internal Moment @ position x : $M = -F(L-x)$

Thus: $\frac{d^2w}{dx^2} = \frac{F}{EI}(L-x)$, w/ $\begin{cases} \text{Clamped End B.C.'s: } w(x=0)=0, \frac{dw}{dx}(x=0)=0 \\ \text{Free End B.C.'s: none} \end{cases}$

Solve to get expression for w :
 \Rightarrow use Laplace; or use trial solution $w = A + Bx + Cx^2 + Dx^3$, then apply B.C.'s

$$w = \frac{FL}{2EI} x^2 \left(1 - \frac{x}{3L}\right) \quad \left[\begin{array}{l} \text{Deflection @ } x \text{ due to a point load} \\ \text{F applied at } x=L \end{array} \right]$$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 13

Cantilever Beam w/ a Concentrated Load
UC Berkeley

Clamped end condition:
At $x=0$:
 $w=0$
 $dw/dx = 0$

Free end condition

Maximum deflection @ $x=L$:
 $w_{max} = \left(\frac{L^3}{3EI}\right)F \rightarrow F = \left(\frac{3EI}{L^3}\right)w(x=L) = k_c w(x=L)$

Note that in general, stiffness is a function of location x .

Where $k_c = \frac{3EI}{L^3} \triangleq$ stiffness @ location $x=L$

$\left[I = \frac{1}{12}Wh^3\right] \Rightarrow k_c = \frac{1}{4}EW\frac{h^3}{L^3}$

Ex. $L=100\mu\text{m}$, $W=2\mu\text{m}$, $h=3\mu\text{m}$
poly silicon $\rightarrow E=150\text{ GPa}$
 $k_c = \frac{1}{4}(150\text{ G})(2\mu)\left(\frac{3\mu}{100\mu}\right)^3 = 0.6\text{ N/m}$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 14

 **Maximum Stress in a Bent Cantilever**

From before, the radius of curvature is given by

$$\frac{1}{R} = \frac{d^2w}{dx^2} = \frac{F}{EI}(L-x) \Rightarrow \text{maximized where } R \rightarrow 0$$

→ occurs at the support, where $x=0$:

$$\text{at } [x=0] \Rightarrow \frac{1}{R} = \frac{d^2w}{dx^2} = \frac{FL}{EI}$$

Strain is maximized:

- ① At top surface → tensile
- ② At bottom surface → compressive

$$\epsilon_{max} = -\frac{z}{R} = \frac{h}{2} \frac{1}{R} = \frac{h}{2} \frac{FL}{EI}$$

$[I = \frac{1}{12}Wh^3] \Rightarrow \epsilon_{max} = \frac{h}{2} \frac{FL}{EI} \frac{12}{Wh^3} = \frac{6L}{EWh^2} F$

$$\therefore \sigma_{max} = \epsilon_{max} E = \frac{6L}{Wh^2} F \quad \left(\text{Maximum Stress in a Bent Cantilever} \right)$$

EE_C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 15

 **Stress Gradients in Cantilevers**

EE_C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 16

Vertical Stress Gradients

- Variation of residual stress in the direction of film growth
- Can warp released structures in z-direction

EE_C245: Introduction to MEMS Design
LecM 8
C. Nguyen
9/28/07
17

Stress Gradients in Cantilevers

- Below: surface micromachined cantilever deposited at a high temperature then cooled → assume compressive stress

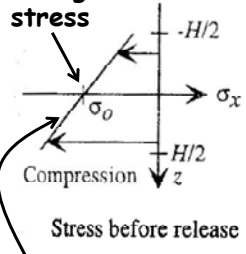

Before release

After release,
but before bending

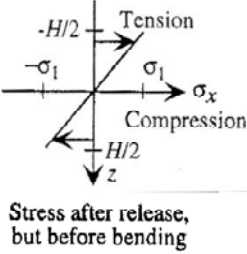

After bending

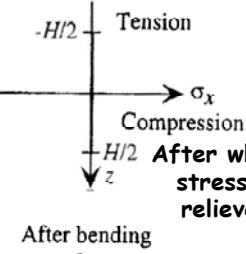

Average stress

Stress before release

Stress gradient

Stress after release,
but before bending

After bending

Once released, beam length increases slightly to relieve average stress

But stress gradient remains → induces moment that bends beam

EE_C245: Introduction to MEMS Design
LecM 8
C. Nguyen
9/28/07
18

Stress Gradients in Cantilevers (cont)

UC Berkeley

Find the radius of curvature.

Prior to release, axial stress is: $\sigma = \sigma_0 - \frac{\sigma_1}{(H/2)} z$

The internal moment:

$$M_x = \int_{-H/2}^{H/2} [(W \cdot dz) \sigma] \cdot z = W \int_{-H/2}^{H/2} \left(z \sigma_0 - \frac{\sigma_1 z^2}{(H/2)} \right) dz = W \left(\frac{1}{2} \sigma_0 z^2 - \frac{2 \sigma_1 z^3}{3H} \right) \Big|_{-H/2}^{H/2}$$

$$= W \left(\frac{1}{2} \sigma_0 \frac{H^2}{4} - \frac{2}{3} \sigma_1 \frac{H^2}{8} - \frac{1}{2} \sigma_0 \frac{H^2}{4} + \frac{2 \sigma_1 H^2}{3(8)} \right) = -\frac{1}{6} \sigma_1 W H^2 = M_x$$

Thus, the radius curvature is:

$$\frac{1}{R} = -\frac{M_x}{EI} \rightarrow R = -\frac{EI}{M_x} = -\frac{E' \left(\frac{1}{12} W H^3 \right)}{-\frac{1}{6} \sigma_1 W H^2} = \frac{1}{2} \frac{E H}{\sigma_1}$$

Biaxial Stress Gradient $\left[I = \frac{1}{12} W H^3 \right]$

$$\Rightarrow R = \frac{1}{2} \frac{E}{(1-\nu)} \frac{H}{\sigma_1}$$

$\sigma_1 = \frac{1}{2} \frac{E}{(1-\nu)} \frac{H}{R} \Rightarrow R$ can be used to determine stress gradient

Radius of Curvature for a Cantilever w/ Stress Gradient

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 19

Measurement of Stress Gradient

UC Berkeley

- Use cantilever beams
 - Strain gradient (Γ = slope of strain-thickness curve) causes beams to deflect up or down
 - Assuming linear strain gradient Γ , $z = \Gamma L^2/2$

■ compressive
■ tensile

[P. Krulevitch Ph.D.]

UC Berkeley

Folded-Flexure Suspensions

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 21

UC Berkeley

Folded-Beam Suspension

- Use of folded-beam suspension brings many benefits
 - ↪ Stress relief: folding truss is free to move in y-direction, so beams can expand and contract more readily to relieve stress
 - ↪ High y-axis to x-axis stiffness ratio

Comb-Driven Folded Beam Actuator

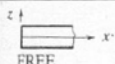

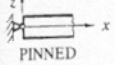

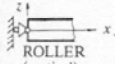

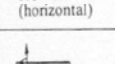

Folding Truss

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 22

Beam End Conditions

TABLE 4.1
Types of commonly used support conditions for beams and frames

Type of support	Displacement boundary conditions	Force boundary conditions
 FREE	None	All, as specified
 PINNED	$u = 0$ $w = 0$	Moment is specified
 ROLLER (vertical)	$u = 0$	Transverse force and moment are specified
 ROLLER (horizontal)	$w = 0$	Horizontal force and bending moment are specified
 FIXED or CLAMPED	$u = 0$ $w = 0$ $dw/dx = 0$	None specified

Common Loading & Boundary Conditions

- Displacement equations derived for various beams with concentrated load F or distributed load f
- Gary Fedder Ph.D. Thesis, EECS, UC Berkeley, 1994

(a) cantilever beam, concentrated load.

(b) cantilever beam, distributed load.

(c) guided-end beam, concentrated load.

(d) guided-end beam, distributed load.

(e) clamped-clamped beam, concentrated load.

(f) clamped-clamped beam, distributed load.

cantilever	guided-end	fixed-fixed
$x = \frac{F_x L}{E h w}$	$x = \frac{F_x L}{E h w}$	$x = \frac{F_x L}{4 E h w}$
$y = 4 \frac{F_y L^3}{E h w^3}$	$y = \frac{F_y L^3}{F h w^3}$	$y = \frac{1}{16} \frac{F_y L^3}{E h w^3}$
$z = 4 \frac{F_z L^3}{E w h^3}$	$z = \frac{F_z L^3}{E w h^3}$	$z = \frac{1}{16} \frac{F_z L^3}{E w h^3}$

(a) Concentrated load.

cantilever	guided-end	fixed-fixed
$x = \frac{f_x L}{E}$	$x = \frac{f_x L}{E}$	$x = \frac{f_x L}{4 E}$
$y = \frac{3}{2} \frac{f_y L^4}{E h w^3}$	$y = \frac{1}{2} \frac{f_y L^4}{E h w^3}$	$y = \frac{1}{32} \frac{f_y L^4}{E h w^3}$
$z = \frac{3}{2} \frac{f_z L^4}{E w h^3}$	$z = \frac{1}{2} \frac{f_z L^4}{E w h^3}$	$z = \frac{1}{32} \frac{f_z L^4}{E w h^3}$

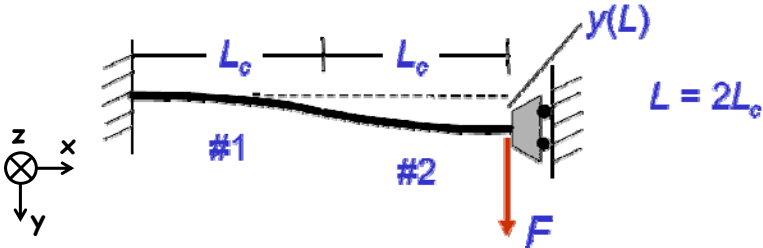

(b) Distributed load.

24

Series Combinations of Springs

UC Berkeley

- For springs in series w/ one load
 - Deflections add
 - Spring constants combine like "resistors in parallel"

$$y(L) = F/k = 2 y(L_c) = 2 (F/k_c) = F(1/k_c + 1/k_c)$$

Compliances effectively add:

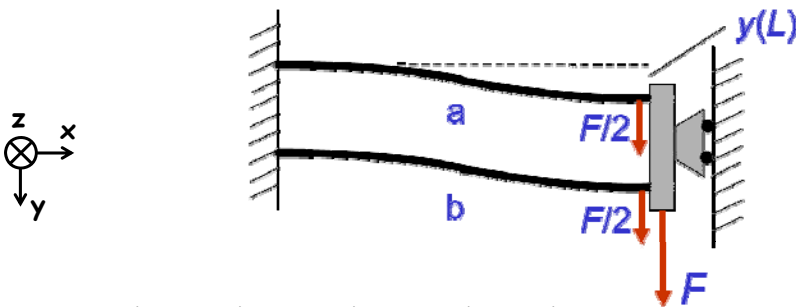

$$\boxed{1/k = 1/k_c + 1/k_c} \rightarrow \boxed{k = k_c || k_c}$$

EE_C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 25

Parallel Combinations of Springs

UC Berkeley

- For springs in parallel w/ one load
 - Load is shared between the two springs
 - Spring constant is the sum of the individual spring constants

$$y(L) = F/k = F_a/k_a = F_b/k_b = (F/2) (1/k_a)$$

$$\boxed{k = 2 k_a}$$

EE_C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 26

Folded-Flexure Suspension Variants

UC Berkeley

- Below: just a subset of the different versions
- All can be analyzed in a similar fashion

(a) Inner fold, continuous truss (b) Inner fold, discontinuous truss (c) Outer fold, continuous truss (d) Outer fold, discontinuous truss

[From Michael Judy, Ph.D. Thesis, EECS, UC Berkeley, 1994]

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 27

Deflection of Folded Flexures

UC Berkeley

Half of F absorbed in other half (symmetrical)

4 sets of these pairs, each of which gets $\frac{1}{4}$ of the total force F

This equivalent to two cantilevers of length $L_c = L/2$

Composite cantilever free ends attach here

$L_c = \frac{L}{2}$

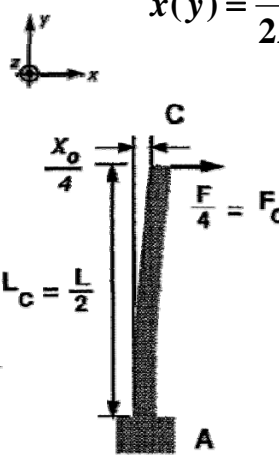

$\frac{F}{4} = F_c$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 28

Constituent Cantilever Spring Constant

UC Berkeley

- From our previous analysis:

$$x(y) = \frac{F_c L_c}{2EI_z} y^2 \left(1 - \frac{y}{3L_c} \right) = \frac{F_c y^2}{6EI_z} (3L_c - y)$$

- From which the spring constant is:

$$k_c = \frac{F_c}{x(L_c)} = \frac{3EI_z}{L_c^3}$$

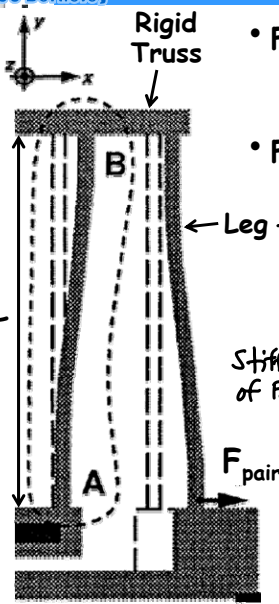

- Inserting $L_c = L/2$

$$k_c = \frac{3EI_z}{(L/2)^3} = \frac{24EI_z}{L^3}$$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 29

Overall Spring Constant

UC Berkeley

- Four pairs of clamped-guided beams
 - In each pair, beams bend in series
 - (Assume trusses are inflexible)
- Force is shared by each pair $\rightarrow F_{\text{pair}} = F/4$

total force on shuttle

Leg \rightarrow Displacement of two legs add
 \hookrightarrow thus, springs are in series:

$$x = \frac{F_{\text{pair}}}{k_{\text{pair}}} = \frac{F_{\text{pair}}}{k_{\text{leg}} \parallel k_{\text{leg}}} = \left(\frac{F}{4} \right) \left(\frac{1}{k_{\text{leg}}} + \frac{1}{k_{\text{leg}}} \right)$$

Stiffness of Pair $\rightarrow k_{\text{pair}} = k_{\text{leg}} \parallel k_{\text{leg}} = \frac{k_c}{2}$

From before: $k_{\text{leg}} = k_c \parallel k_c = \frac{k_c}{2}$

Thus:

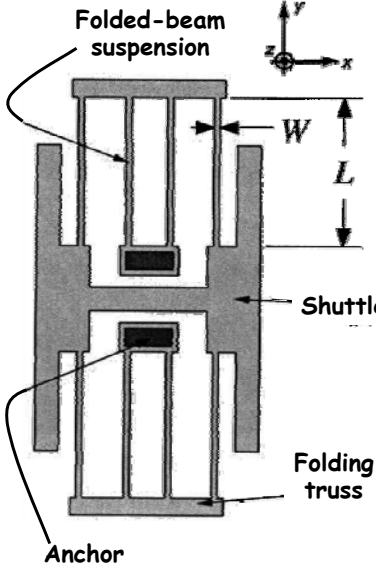

$$x = \left(\frac{F}{4} \right) \left(\frac{2}{k_c} + \frac{2}{k_c} \right) = \frac{F}{k_c} = \frac{F}{k_{\text{tot}}}$$

$$\Rightarrow k_{\text{tot}} = k_c = \frac{24EI_z}{L^3}$$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 30

Folded-Beam Stiffness Ratios

- In the x-direction:

$$k_x = \frac{24EI_z}{L^3}$$
- In the z-direction:
 Same flexure and boundary conditions

$$k_z = \frac{24EI_x}{L^3}$$
- In the y-direction:
 [See Senturia, §9.2]
$$k_y = \frac{8EWh}{L}$$
- Thus:
$$\frac{k_y}{k_x} = 4 \left(\frac{L}{W} \right)^2$$

**Much
stiffer in
y-direction!**

Clamped-Guided Beam Under Axial Load

UC Berkeley

- Important case for MEMS suspensions, since the thin films comprising them are often under residual stress
- Consider small deflection case: $y(x) \ll L$

Governing differential equation: (Euler Beam Equation)

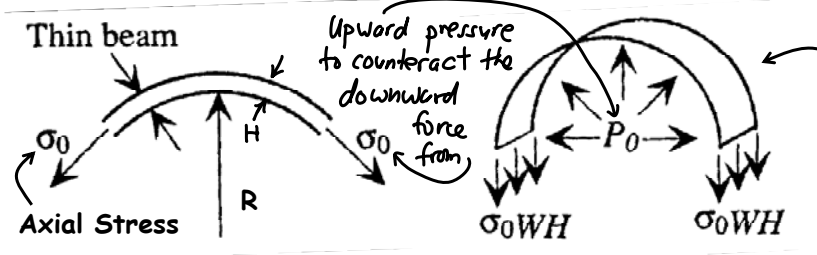

$$EI_z \frac{d^4 y}{dx^4} - S \frac{d^2 y}{dx^2} = F \delta(x-L)$$

Axial Load
Unit impulse @ $x=L$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 35

The Euler Beam Equation

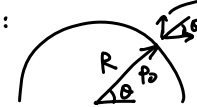

UC Berkeley

- Axial stresses produce no net horizontal force; but as soon as the beam is bent, there is a net downward force
 - ↳ For equilibrium, must postulate some kind of upward load on the beam to counteract the axial stress-derived force
 - ↳ For ease of analysis, assume the beam is bent to angle π

Downward Vertical Force = $2\sigma_0 WH$

Upward Force due to P_0 :

$$F_u = \int_0^\pi (P_0 \sin \theta) W (R d\theta)$$

$$= -P_0 WR \cos \theta \Big|_0^\pi = 2RWP_0$$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 36

The Euler Beam Equation

UC Berkeley

[Equilibrium] $\Rightarrow 2RW P_0 = 2\sigma_0 W H \rightarrow P_0 = \frac{\sigma_0 H}{R}$

$\left[q_0 = \frac{\text{beam load}}{\text{unit length}} = P_0 W, \frac{1}{R} = \frac{d^2 w}{dx^2} \right] \Rightarrow q_0 = \sigma_0 W H \frac{d^2 w}{dx^2}$

beam displacement

Using the differential beam bending equation:

$\frac{d^2 w}{dx^2} = -\frac{M}{EI} \rightarrow \frac{d^4 w}{dx^4} = \frac{q}{EI} \leftarrow \text{load unit length}$

$EI \frac{d^4 w}{dx^4} = q + q_0$

external load

equiv. load accounting for the axial stress contribution to the bending stiffness

$\left[q_0 = \sigma_0 W H \frac{d^2 w}{dx^2} \right] \Rightarrow EI \frac{d^4 w}{dx^4} - (\sigma_0 W H) \frac{d^2 w}{dx^2} = q$ [Euler Beam Equation]

tension in the beam = $S \leftarrow$ a force

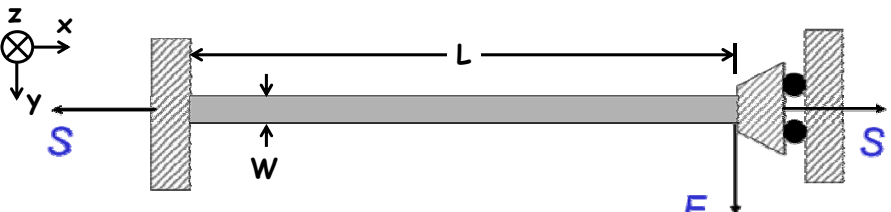

Note: Use of the full bend angle of π to establish conditions for load balance; but this returns us to case of small displacements and small angles

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 37

Clamped-Guided Beam Under Axial Load

UC Berkeley

- Important case for MEMS suspensions, since the thin films comprising them are often under residual stress
- Consider small deflection case: $y(x) \ll L$

Governing differential equation: (Euler Beam Equation)

$$EI_z \frac{d^4 y}{dx^4} - S \frac{d^2 y}{dx^2} = F \delta(x-L)$$

Axial Load Unit impulse @ $x=L$

EE C245: Introduction to MEMS Design LecM 8 C. Nguyen 9/28/07 38

Solving the ODE

- Can solve the ODE using standard methods
 - ↳ Senturia, pp. 232-235: solves ODE for case of point load on a clamped-clamped beam (which defines B.C.'s)
 - ↳ For solution to the clamped-guided case: see S. Timoshenko, Strength of Materials II: Advanced Theory and Problems, McGraw-Hill, New York, 3rd Ed., 1955
- Result from Timoshenko:

$$S > 0 \text{ (tension)} \quad k^{-1} = \frac{pL - 2 \tanh(pL/2)}{p|S|} = \frac{y(x=L)}{F}$$

$$S < 0 \text{ (compression)}$$

$$k^{-1} = \frac{-pL + 2 \tanh(pL/2)}{p|S|} = \frac{y(x=L)}{F}$$

where $p = \sqrt{\frac{|S|}{EI}}$

EE C245: Introduction to MEMS Design
LecM 8
C. Nguyen
9/28/07
39

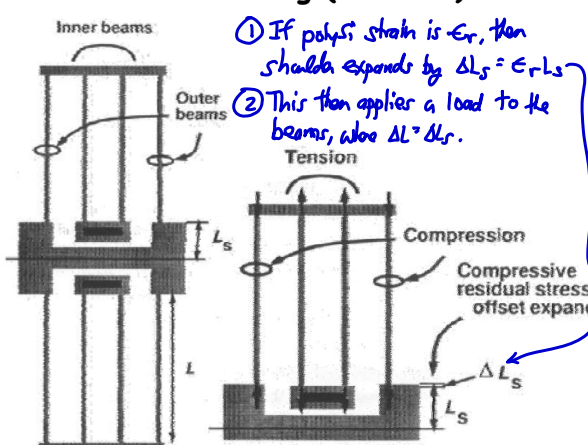

Design Implications

- Straight flexures
 - ↳ Large tensile S means flexure behaves like a tensioned wire (for which $k^{-1} = L/S$)
 - ↳ Large compressive S can lead to buckling ($k^{-1} \rightarrow \infty$)
- Folded flexures
 - ↳ Residual stress only partially released
 - ↳ Length from truss to shuttle's centerline differs by L_s for inner and outer legs

③ Beam strain:

$$\epsilon_b = \frac{\Delta L}{L} = \frac{\Delta L_s}{L} = \epsilon_r \frac{L_s}{L}$$

over ↗

EE C245: Introduction to MEMS Design
LecM 8
C. Nguyen
9/28/07
40

Effect on Spring Constant

- Residual compression on outer legs with same magnitude of tension on inner legs: strain in the polysi

Beam Strain: $\epsilon_b = \pm \epsilon_r \left(\frac{L_s}{L} \right)$; Stress Force: $S = \pm E \epsilon_r \left(\frac{L_s}{L} \right) Wh$

Strain in the beams Expansion of the Shoulder = ΔL_s

- Spring constant becomes: $= \epsilon_r L_s$ ← This expansion applies a load on the beams

[$\Delta L = \Delta L_s$] $\epsilon_b = \epsilon_r \frac{\Delta L}{L} = \epsilon_r \frac{L_s}{L}$

$$k = 4(k_{\text{com}}^{-1} + k_{\text{ten}}^{-1})^{-1}$$

$$k = 4 \left[\frac{-pL + 2 \tanh(pL/2)}{p|S|} + \frac{pL - 2 \tanh(pL/2)}{p|S|} \right]^{-1}$$

of the flexure

- Remedies:**
 - Reduce the shoulder width L_s to minimize stress in legs
 - Compliance in the truss lowers the axial compression and tension and reduces its effect on the spring constant
