EECS 42 Intro. Digital Electronics, Fall 2003

Lecture 4: 09/04/03 A.R. Neureuther

Version Date 09/01/03

EECS 42 Introduction to Electronics for Computer Science Andrew R. Neureuther

Lecture #4 Capacitors; I vs. V

- Capacitors and Energy Stored
- Current versus Voltage for Circuits
- Equivalent Straight Line Circuits
 - Thevenin; Norton

Schwarz and Oldham: 5.1 – 5.2; 3.1

Lecture 4: 09/04/03 A.R. Neureuther Version Date 09/01/03

BASIC CIRCUIT ELEMENTS

- Voltage Source (always supplies some constant given voltage like ideal battery)
- Current Source (always supplies some constant given current)
- Resistor (Ohm's law)
- Wire ("short" no voltage drop)

Capacitor

(capacitor law – based on energy storage in electric field of a dielectric S&O 5.1-5.2)

• Inductor (inductor law – based on energy storage in magnetic field in space S&O 5.1-5.2)

Lecture 4: 09/04/03 A.R. Neureuther

Version Date 09/01/03

CAPACITOR CIRCUIT ELEMENT

Any two conductors a and b separated by an insulator with a difference in voltage V_{ab} will have an equal and opposite charge on their surfaces whose value is given by $Q=CV_{ab}$, where C is the ${\it capacitance}$ of the structure, and the + charge is on the more positive electrode.

A simple *parallel-plate capacitor* is shown. If the area of the plate is A, the separation d, and the *dielectric constant* of the insulator is ϵ , the capacitance equals $C = A \epsilon/d$

Version Date 09/01/03

CAPACITOR CURRENT/VOLTAGE

Constitutive relationship: Q = C ($V_a - V_b$). $\begin{array}{c|c} i & & a \\ \hline & & \\ &$

Charge and Current are related: Charge is the time integral of Current

So
$$i = \frac{dQ_a}{dt}$$
so $i = C\frac{dv}{dt}$ equivalent to $Q = Cv$
where we use the associated reference directions

Example: A 1 mA current into a 1 pF capacitance produces a voltage change rate of 1mA/1pF = 1 V/ns

ENERGY STORED IN A CAPACITOR

You might think the energy (in Joules) is QV, which has the dimension of joules. But during charging the average voltage was only half the final value of V.

Thus, energy is
$$\frac{1}{2}QV = \boxed{\frac{1}{2}CV^2}$$

Example: A 1 pF capacitance charged to 5 volts has $^{1}\!\!/_{2}(5V)^{2}$ (1pF) = 12.5 pJ

ENERGY STORED IN A CAPACITOR (cont.)

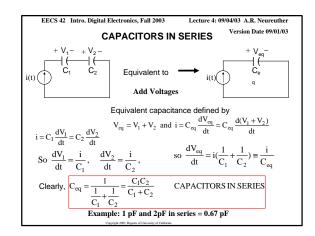

More rigorous derivation: During charging, the power flow is $v\cdot i$ into the capacitor, where i is into + terminal. We integrate the power from $t=0 \ (v=0)$ to t= end (v=V). The integrated power is the energy

ated power is the energy
$$\begin{aligned} t &= t_{Final} \\ E &= \int\limits_{Initial} v \cdot i \ dt = \int\limits_{V} v \cdot \int\limits_{Initial} \frac{dq}{dt} \ dt = \int\limits_{V} v \cdot \int\limits_{Initial} v \\ v &= V_{Initial} \end{aligned}$$

but $dq = C \ dv$. (We are using small q instead of Q to remind us that it is time varying . Most texts use Q.)

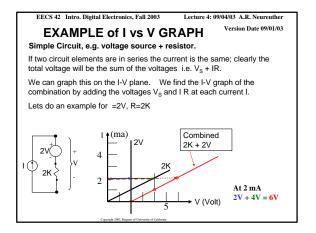

$$E = \int_{V = V_{Initial}}^{V = V_{Final}} Cv \, dv = \frac{1}{2} CV_{Final}^2 - \frac{1}{2} CV_{Initial}^2$$

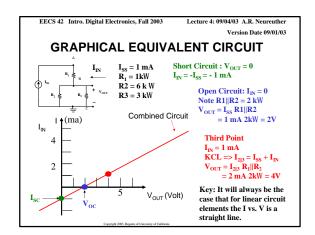

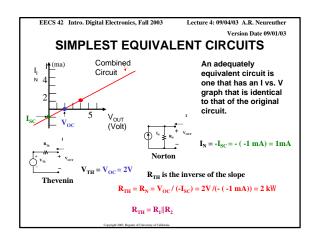

EECS 42 Intro. Digital Electronics, Fall 2003 Lecture 4: 09/04/03 A.R. Neureuther Version Date 09/01/03 Capacitance and Inductance · Capacitors: two plate example; Store energy in the electric field Q = CV, I = C dV/dt and V = (1/C) integral of voltage 1 mA current charging 1 pF $V(t) = (I/C)t = (10-3 \text{ A}/10^{-12} \text{ F}) t = 10^9 \text{ V/s t}$ Energy = ½(CV²) (because average voltage is V/2) · At D.C. time derivatives are zero => C is open circuit C in parallel add; series $1/C = sum(1/C_i)$; short together (infinite current but conserve charge) Inductors: coil example; Store energy in the magnetic field; Flux = LI, V = L dI/dt and I = (1/L) (integral of voltage) At D.C. time derivatives are zero => L is short circuit L in parallel $1/L = sum (1/L_i)$; series add; connect in series when have different currents $=> L_1I_1+L_2I_2 = (L_1+L_2)I_{NEW}$

EECS 42 Intro. Digital Electronics, Fall 2003 Lecture 4: 09/04/03 A.R. Neureuther **EXAMPLE of I vs V GRAPH** Version Date 09/01/03 **Resistors in Series** If two resistors are in series the current is the same; clearly the total voltage will be the sum of the two IR values i.e. I(R₁+R₂). Thus the equivalent resistance is R₁+R₂ and the I-V graph of the series pair is the same as that of the equivalent resistance. Of course we can also find the I-V graph of the combination by adding the voltages directly on the I-V axes. Lets do an example for 1K + 4K resistors | **♦**(ma) At 1 mA 1K 1V + 4V = 5VCombined 1K + 4K Resistors in series add voltages Resistors in parallel add currents

EECS 42 Intro. Digital Electronics, Fall 2003 Lecture 4: 09/04/03 A.R. Neureuther $R_{TH} = R_N$ SHORTCUT METHOS Look at algebraic relation for the example circuit. $\mathbf{V}_{\mathrm{OC}} = \mathbf{I}_{\mathrm{SS}} \; \mathbf{R}_1 || \mathbf{R}_2$ $I_{SC} = -I_{SS}$ $\mathbf{R}_{\mathrm{TH}} = \mathbf{R}_{\mathrm{N}} = \mathbf{V}_{\mathrm{OC}} / (-\mathbf{I}_{\mathrm{SC}})$ $\mathbf{R}_{\mathrm{TH}} = \mathbf{R}_{\mathrm{N}} = (\mathbf{I}_{\mathrm{SS}} \; \mathbf{R}_1 || \mathbf{R}_2) / (\text{-}(\text{-}\mathbf{I}_{\mathrm{SS}})) = \mathbf{R}_1 || \mathbf{R}_2$ In General turn all of the independent sources to zero and find the remaining equivalent resistance seen looking into the terminals. Currents sources are turned to zero current (with any voltage) and voltage sources are turned to zero voltage (with any current).

EECS 42 Intro. Digital Electronics, Fall 2003

Lecture 4: 09/04/03 A.R. Neureuther

I vs. V and Equivalent Circuits

- I vs. V for ideal voltage source is a vertical line at $V = V_{SV}$
- I vs. V for ideal current source is a horizontal line at $I = I_{SC}$
- · I vs. V for a circuit made up of ideal independent sources and resistors is a straight line.
- · The simplest circuit for a straight line is an ideal voltage source and a resistor (Thevenin) or a current source and a parallel resistor (Norton)
- The easiest way to find the I vs. V line is to find the intercepts where I = 0 (open circuit voltage V_T) and where V = 0 (Short circuit current I_N)
- The short-cut for finding the (slope)⁻¹ = $R_T = R_N$ is to turn off all of the independent sources to zero and find the remaining equivalent resistance between the terminals of the elements.
