(2) (a) I decided to use the following design flow:

Synthesize w/ Matlab in z-domain

$$F_{pass} = 2 \cdot \frac{1MHz}{10MHz} = 0.2$$

$$F_{stop} = 2 \cdot \frac{1.5MHz}{10MHz} = 0.3$$

$\Rightarrow$ ellipord(...) = $\boxed{6}$ (filter order)

↓

Break up into Biquads using "tf2sos"

→ estimate Biquad Qs, use inverse bilin. transform

$$s_p = \frac{2}{T}\left(\frac{z_p - 1}{z_p + 1}\right)$$

$$\Rightarrow \left.\begin{array}{l} Q_1 = 0.61 \\ Q_2 = 0.16 \end{array}\right\} \text{"Low Q"}$$

$Q_3 = 6.3$ "Hi Q" (>3)

↓

Implement using Hi- and Lo Q circuits as given in Gregorian & Temes pp. 280.

→ see attached schematics with design equations ut

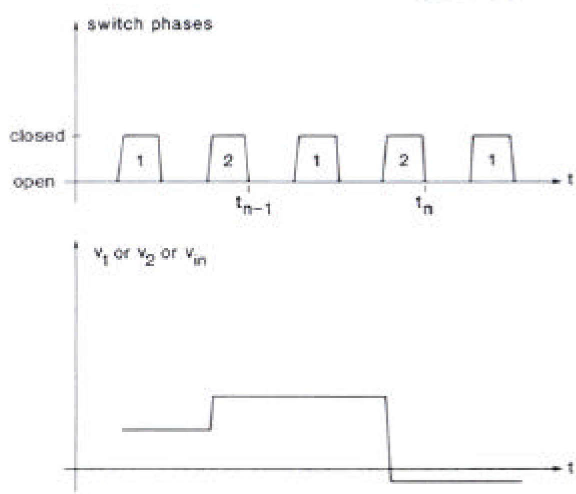
(c)

LoQ

$$H(z) = \frac{a_2 z^2 + a_1 z + a_0}{b_2 z^2 + b_1 z + b_0}$$



(d)

FIGURE 5.10. continued.

$$C_1'' = a_0$$

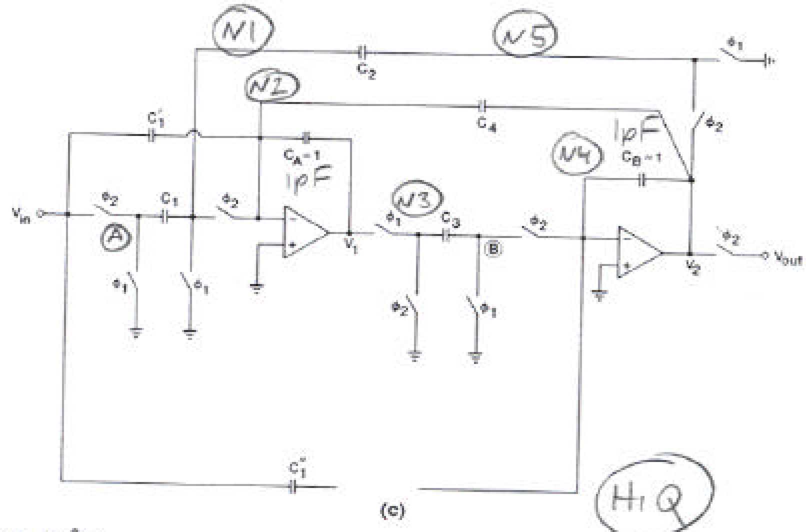
$$C_1' = a_2 - a_0$$

$$C_1 = \frac{a_0 + a_1 + a_2}{C_3}$$

$$C_4 = b_2 - 1$$

$$C_2 C_3 = b_1 + b_2 + 1$$

(Gregorian, Temes)



(c)

$$H(z) = \frac{a_2 z^2 + a_1 z + a_0}{b_2 z^2 + b_1 z + b_0}$$

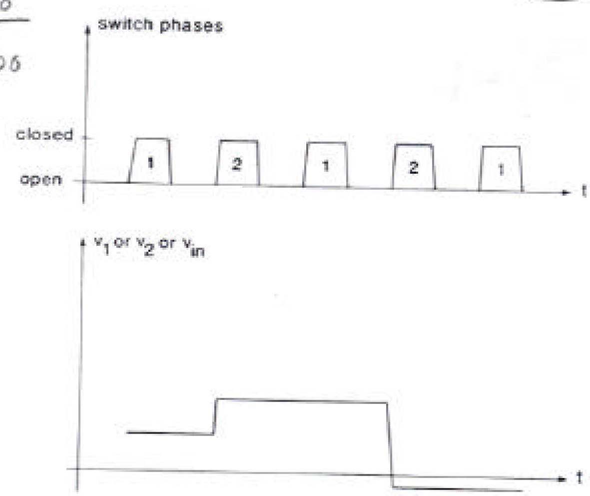
$$C_1'' = \frac{a_2}{b_2}$$

$$C_1' = \frac{a_2 - a_0}{b_2 C_3}$$

$$C_1 = \frac{a_0 + a_1 + a_2}{b_2 C_3}$$

$$C_4 = \frac{1 - 1/b_2}{C_3}$$

$$C_2 C_3 = \frac{1 + b_1 + b_2}{b_2}$$



(d)

FIGURE 5.13. continued.

(Gregorian, Temes)

2) b) Poles and Zeros

Biquad 1:

```
Z1 =

    7.246789558726074e-001 -4.320114746276476e-001i
```

Biquad 3:

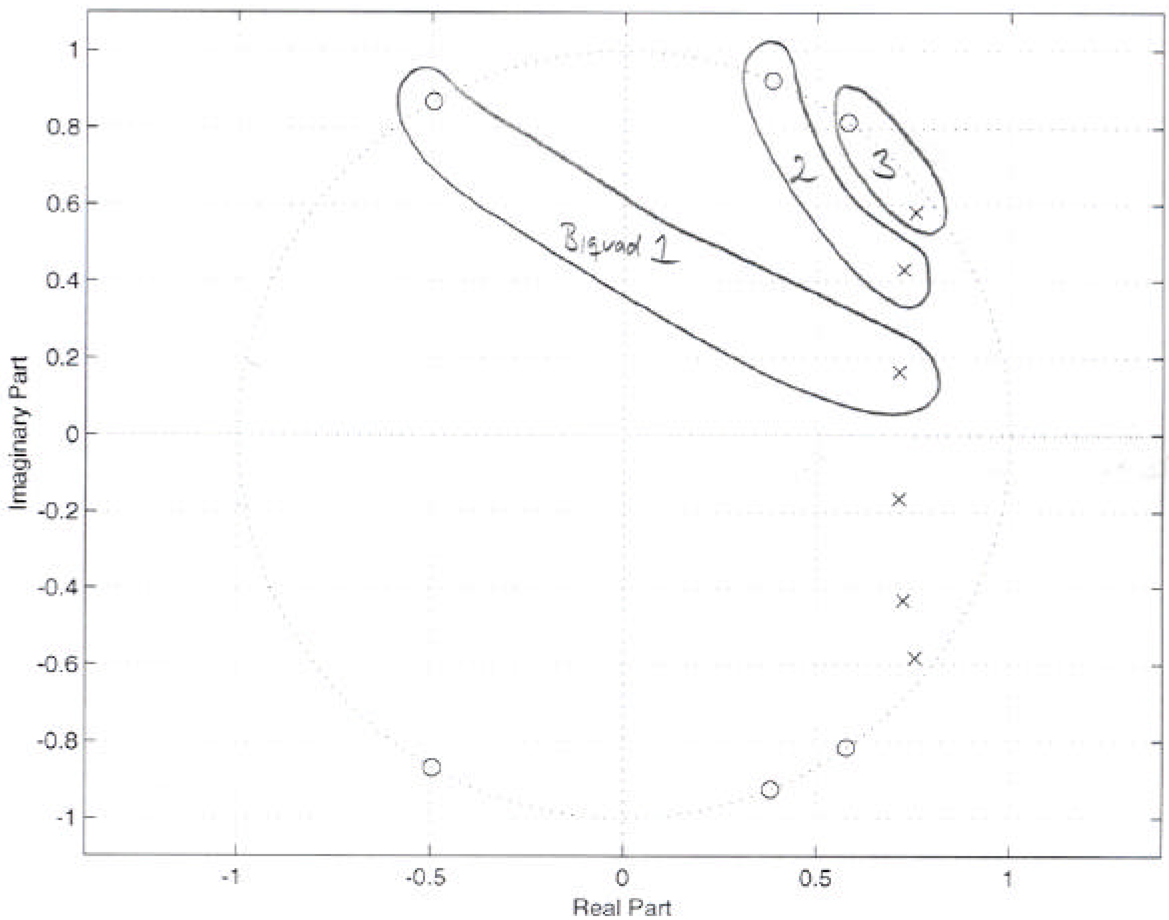
```
Z3 =
    5.785179590177820e-001 +8.156696458088302e-001i
    5.785179590177820e-001 -8.156696458088302e-001i
P3 =
    7.553705109318878e-001 +5.808504547226241e-001i
    7.553705109318878e-001 -5.808504547226241e-001i
```

(Grouping done by Matlab "tf2sos"
→ see next page)

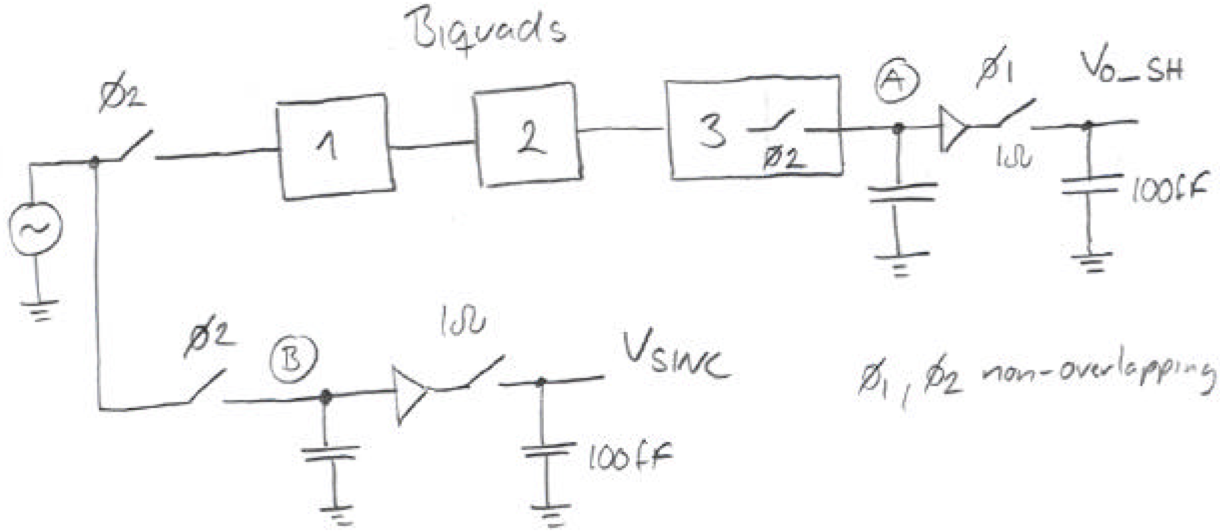
② b)

p/z grouping by Matlab:

("Minimum sensitivity to coefficient tolerances, see e.g. Oppenheim & Schafer)



(2) (c) Top Schematic:



→ (A), (B) are "track and hold nodes", the held value is transferred with ϕ_1 to form an "ideal" staircase voltage ≡ Dirac sampling with falling edge of ϕ_2

→ V_{SINC} will be used in the post processor to eliminate sinc distortion.

$$V_{O\_SH}[dB] - V_{SINC}[dB] \Rightarrow \text{actual discrete time response}$$

→ Biquads scaled in Matlab using:

$$\frac{\sum a}{\sum b} \overset{!}{=} 1 \quad \text{in} \quad \frac{a_2 z^2 + a_1 z + a_0}{b_2 z^2 + b_1 z + b_0} \qquad z \to 1 \text{ @ DC}$$

(see Matlab script)

→ Good agreement w/ Spectre simulation, see Plots 1, 2

(2) d) found: $A_{min} \cong \underline{\underline{1200}}$ for $R_p = 0.12\,dB$, assuming f_{corner} is allowed to shift

$$\cong \frac{8\,kHz}{1\,MHz} = 0.8\,\%$$

→ Stopband attenuation appears to be insensitive to low gain / gain variations.

→ See plots 3, 4
