Recursive Functions

Recursive Functions

Definition: A function is called recursive if the body of that function calls itself, either directly or indirectly

Implication: Executing the body of a recursive function may require applying that function

Drawing Hands, by M. C. Escher (lithograph, 1948)

Digit Sums

$$2+0+1+5 = 8$$

- If a number `a` is divisible by 9, then `sum_digits(a)` is also divisible by 9
- Useful for typo detection!

A checksum digit is a function of all the other digits; It can be computed to detect typos

- Credit cards actually use the Luhn algorithm, which we'll implement after `digit_sum`

Sum Digits Without a While Statement

```
def split(n):
    """Split positive n into all but its last digit and its last digit."""
    return n // 10, n % 10

def sum_digits(n):
    """Return the sum of the digits of positive integer n."""
    if n < 10:
        return n
    else:
        all_but_last, last = split(n)
        return sum_digits(all_but_last) + last
```

The Anatomy of a Recursive Function

- The `def statement header` is similar to other functions
- Conditional statements check for `base cases`
- Base cases are evaluated `without recursive calls`
- Recursive cases are evaluated `with recursive calls`

```
def sum_digits(n):
    """Return the sum of the digits of positive integer n."""
    if n < 10:
        return n
    else:
        all_but_last, last = split(n)
        return sum_digits(all_but_last) + last
```

(Demo)

Recursion in Environment Diagrams

Recursion in Environment Diagrams

```

1 def fact(n):
2     if n == 0:
3         return 1
4     else:
5         return n * fact(n-1)
6
7 fact(3)

```

- The same function `fact` is called multiple times
- Different frames keep track of the different arguments in each call
- What `n` evaluates to depends upon the current environment
- Each call to `fact` solves a simpler problem than the last: smaller `n`

Interactive Diagram

Iteration vs Recursion

Iteration is a special case of recursion

$$4! = 4 \cdot 3 \cdot 2 \cdot 1 = 24$$

Using While:

```

def fact_iter(n):
    total, k = 1, 1
    while k <= n:
        total, k = total*k, k+1
    return total

```

Math: $n! = \prod_{k=1}^n k$

Names: `n, total, k, fact_iter`

Using recursion:

```

def fact(n):
    if n == 0:
        return 1
    else:
        return n * fact(n-1)

```

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ n \cdot (n-1)! & \text{otherwise} \end{cases}$$

`n, fact`

Verifying Recursive Functions

The Recursive Leap of Faith

```

def fact(n):
    if n == 0:
        return 1
    else:
        return n * fact(n-1)

```

Is `fact` implemented correctly?

1. Verify the base case
2. Treat `fact` as a functional abstraction!
3. Assume that `fact(n-1)` is correct
4. Verify that `fact(n)` is correct

Mutual Recursion

Recursion and Iteration

The Luhn Algorithm

Used to verify credit card numbers

From Wikipedia: http://en.wikipedia.org/wiki/Luhn_algorithm

- First: From the rightmost digit, which is the check digit, moving left, double the value of every second digit; if product of this doubling operation is greater than 9 (e.g., $7 \cdot 2 = 14$), then sum the digits of the products (e.g., $10: 1 + 0 = 1$, $14: 1 + 4 = 5$)
- Second: Take the sum of all the digits

1	3	8	7	4	3	
2	3	1+6=7	7	8	3	= 30

The Luhn sum of a valid credit card number is a multiple of 10

(Demo)

Converting Recursion to Iteration

Can be tricky: Iteration is a special case of recursion.

Idea: Figure out what state must be maintained by the iterative function.

```

def sum_digits(n):
    """Return the sum of the digits of positive integer n."""
    if n < 10:
        return n
    else:
        all_but_last, last = split(n)
        return sum_digits(all_but_last) + last

```

What's left to sum

A partial sum

(Demo)

Converting Iteration to Recursion

More formulaic: Iteration is a special case of recursion.

Idea: The state of an iteration can be passed as arguments.

```
def sum_digits_iter(n):
    digit_sum = 0
    while n > 0:
        n, last = split(n)
        digit_sum = digit_sum + last
    return digit_sum

def sum_digits_rec(n, digit_sum):
    if n == 0:
        return digit_sum
    else:
        n, last = split(n)
        return sum_digits_rec(n, digit_sum + last)
```

Updates via assignment become...

...arguments to a recursive call
