Function Examples

Announcements

Hog Contest Rules

- Up to two people submit one entry; Max of one entry per person
- Slight rule changes
- Your score is the number of entries against which you win more than 50.00001% of the time
- Strategies are time-limited
- All strategies must be deterministic, pure functions of the players' scores
- All winning entries will receive extra credit
- The real prize: honor and glory
- See website for detailed rules

Fall 2011 Winners

Kaylee Mann Yan Duan & Ziming Li Brian Prike & Zhenghao Qian Parker Schuh & Robert Chatham

Fall 2012 Winners

Chenyang Yuan Joseph Hui

Fall 2013 Winners

Paul Bramsen Sam Kumar & Kangsik Lee Kevin Chen

Fall 2014 Winners

Alan Tong & Elaine Zhao Zhenyang Zhang Adam Robert Villaflor & Joany Gao Zhen Qin & Dian Chen Zizheng Tai & Yihe Li

Abstraction

Functional Abstractions

```
def square(x):
                                                  def sum_squares(x, y):
                 return mul(x, x)
                                                       return square(x) + square(y)
                     What does sum_squares need to know about square?
                                                                           Yes
• Square takes one argument.
• Square has the intrinsic name square.
                                                                            No
• Square computes the square of a number.
                                                                           Yes
• Square computes the square by calling mul.
                                                                            No
            def square(x):
                                                    def square(x):
                                                        return mul(x, x-1) + x
                 return pow(x, 2)
                   If the name "square" were bound to a built-in function,
                          sum_squares would still work identically.
```

Choosing Names

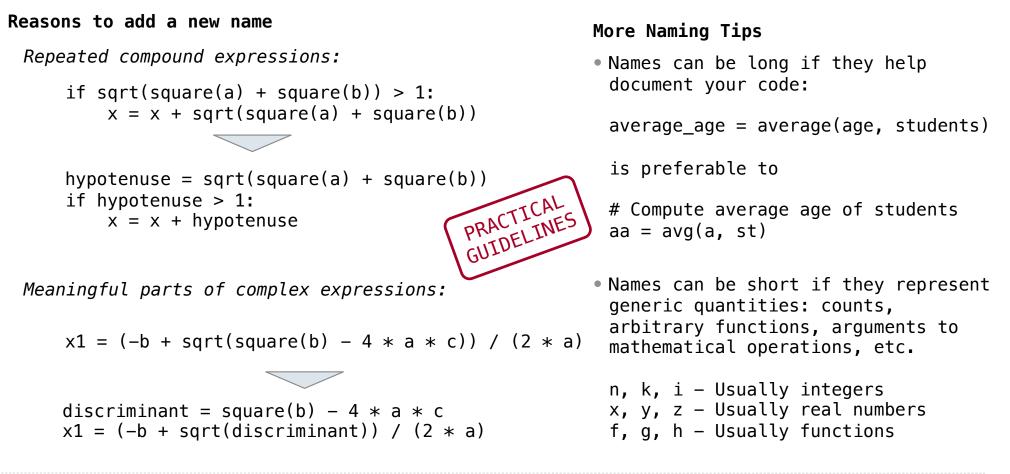

Names typically don't matter for correctness

but

they matter a lot for composition

From:	To:	Names should convey the meaning or purpose of the values to which they are bound.	
true_false	rolled_a_one		
d	dice	The type of value bound to the name is best documented in a function's docstring.	
helper	take_turn		
my_int	num_rolls	Function names typically convey their effect (print), their behavior (triple), or the value returned (abs).	
l, I, O	k, i, m		

Which Values Deserve a Name

Testing

Test-Driven Development

Write the test of a function before you write the function.

A test will clarify the domain, range, & behavior of a function.

Tests can help identify tricky edge cases.

Develop incrementally and test each piece before moving on.

You can't depend upon code that hasn't been tested.

Run your old tests again after you make new changes.

Bonus idea: Run your code interactively.

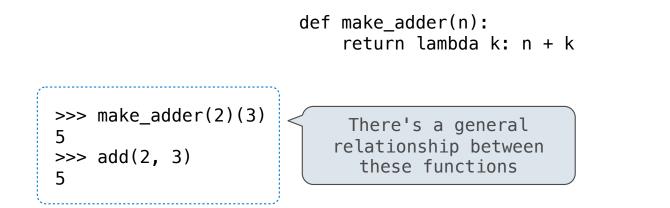

Don't be afraid to experiment with a function after you write it.

Interactive sessions can become doctests. Just copy and paste.

(Demo)

Currying

Function Currying

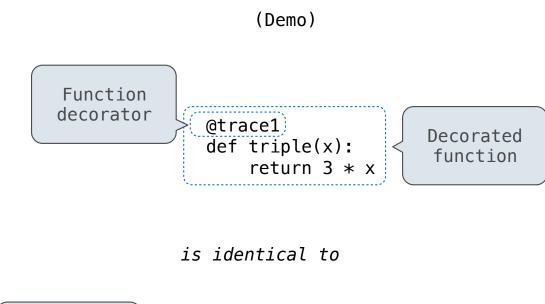

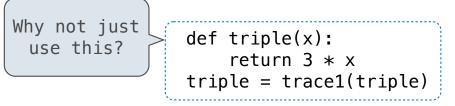

Curry: Transform a multi-argument function into a single-argument, higher-order function

(Demo)

Decorators

Function Decorators

Review

What Would Python Display?

The print function returns None. It also displays its arguments (separated by spaces) when it is called.

<pre>from operator import add, mul def square(x):</pre>	This expression	Evaluates to	Interactive Output
return mul(x, x)	5	5	5
A function that takes any argument and returns a	print(5)	None	5
function that returns that arg	<pre>print(print(5)) None</pre>	None	5 None
<pre>def (delay(arg): print('delayed') def g(): return arg return g</pre>	<pre>delay(delay)()(6)()</pre>	6	delayed delayed 6
Names in nested def statements can refer to their enclosing scope	<pre>print(delay(print)()(4))</pre>	None	delayed 4 None
