# 61A Extra Lecture 1

Announcements

- If you want 1 unit (pass/no pass) of credit for this CS 98, stay tuned for a Piazza post

  - Only for people who really want extra work that's beyond the scope of normal CS 61A

- Anyone is welcome to attend the extra lectures, whether or not they enroll

- Permanent lecture times are TBD, but probably Wednesday evening or Monday evening

Newton's Method

Newton's Method Background

Quickly finds accurate approximations to zeroes of differentiable functions!

$f(x) = x^2 - 2$

A "zero" of a function f is an input x such that f(x)=0

x=1.414213562373095
Application: a method for computing square roots, cube roots, etc.

The positive zero of $f(x) = x^2 - a$ is $\sqrt{a}$. (We're solving the equation $x^2 = a$.)

Newton's Method

Given a function f and initial guess x,

Repeatedly improve x:

Compute the value of f
at the guess: f(x)

Compute the derivative
of f at the guess: f'(x)

Update guess x to be:

$$x - \frac{f(x)}{f'(x)}$$

Finish when f(x) = 0 (or close enough)

Change to x:
−f(x)/f'(x)

Length from 0:
−f(x)

Slope of this
tangent line
is f'(x)

Current point:
(x, f(x))

Using Newton's Method
How to find the square root of 2?

```
>>> f  = lambda x: x*x - 2
>>> df = lambda x: 2*x
>>> find_zero(f, df)
1.4142135623730951
```

$$f(x) = x^2 - 2$$
$$f'(x) = 2x$$

Applies Newton's method

How to find the cube root of 729?

```
>>> g  = lambda x: x*x*x - 729
>>> dg = lambda x: 3*x*x
>>> find_zero(g, dg)
9.0
```

$$g(x) = x^3 - 729$$
$$g'(x) = 3x^2$$

Iterative Improvement

Special Case: Square Roots

How to compute square_root(a)

Idea: Iteratively refine a guess x about the square root of a

$$x = \frac{x + \frac{a}{x}}{2}$$

Update:

(Demo)

Babylonian Method

Implementation questions:

What guess should start the computation?

How do we know when we are finished?

Special Case: Cube Roots

How to compute cube_root(a)

Idea: Iteratively refine a guess x about the cube root of a

$$x = \frac{2 \cdot x + \frac{a}{x^2}}{3}$$

Update: (Demo)

Implementation questions:

What guess should start the computation?

How do we know when we are finished?

Implementing Newton's Method

(Demo)

Extensions

Approximate Differentiation

Differentiation can be performed
symbolically or numerically

f(x) = x² − 16

f'(x) = 2x

f'(2) = 4

$$f'(x) = \lim_{a \to 0} \frac{f(x+a) - f(x)}{a}$$

$$f'(x) \approx \frac{f(x+a) - f(x)}{a} \quad \text{(if } a \text{ is small)}$$

(Demo)

Critical Points and Inverses

Maxima, minima, and inflection points of a differentiable function occur
when the derivative is 0

(Demo)

The inverse f⁻¹(y) of a differentiable, one-to-one function computes the
value x such that f(x) = y
