## 1 Balanced Search Trees

(a) Convert the red-black tree into a 2-4 tree. Solid nodes are black.

(b) Insert the keys 13 and 17 into the resulting 2-4 tree. Assume that, if a node has 4 keys, we choose to push up the left of the 2 middle keys (so the $2^{\text {nd }}$ key from the left).
(c) Convert the resulting 2-4 tree into a valid left-leaning red-black tree.
(d) Given a 2-4 tree containing $N$ keys, describe how you can obtain the keys in sorted order in worst case $O(N)$ time.
(e) If a 2-4 tree has depth $H$ (that is, the leaves are at a distance of $H$ from the root), what is the maximum number of comparisons done in the corresponding red-black tree to find whether a certain key is present in the tree?

## 2 Tries

List the words encoded by the following trie, then draw the resulting trie after inserting the words indent, inches, and trie.

## 3 Skip Lists

Draw the resulting skip list after adding the following numbers at the specified random heights. Highlight the links traversed to find 148.

| Number | 40 | 41 | 43 | 48 | 54 | 59 | 77 | 128 | 131 | 139 | 148 | 161 | 170 | 179 | 189 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Height | 2 | 1 | 3 | 1 | 3 | 1 | 4 | 2 | 2 | 1 | 1 | 3 | 2 | 1 | 1 |
