CS 61BFall 2021

Heaps and Hashing

Exam Prep Discussion 10: October 25, 2021

Fill in the Blanks

Fill in the following blanks related to min-heaps. Let N is the number of elements in the min-heap. For the entirety of this question, assume the elements in the min-heap are distinct.

1.	removeMin has a best case runtime of and a worst case runtime of
2.	insert has a best case runtime of and a worst case runtime of
3.	A or traversal on a min-heap may output the elements in sorted order. Assume there are at least 3 elements in the min-heap.
4.	The fourth smallest element in a min-heap with 1000 elements can appear in places in the heap.
5.	Given a min-heap with 2^N-1 distinct elements, for an element
	• to be on the second level it must be less than element(s) and greater than element(s).
	• to be on the bottommost level it must be less than element(s) and greater than element(s).
	$\it Hint: \ \ A \ complete \ binary \ tree \ (with a full last-level) \ has \ 2^N-1 \ elements,$

with N being of levels.

2 Heap Mystery

We are given the following array representing a min-heap where each letter represents a **unique** number. Assume the root of the min-heap is at index zero, i.e. A is the root. Note that there is **no** significance of the alphabetical ordering, i.e. just because B precedes C in the alphabet, we do not know if B is less than or greater than C.

Array: [A, B, C, D, E, F, G]

Four unknown operations are then executed on the min-heap. An operation is either a removeMin or an insert. The resulting state of the min-heap is shown below.

Array: [A, E, B, D, X, F, G]

- (a) Determine the operations executed and their appropriate order. The first operation has already been filled in for you!
 - 1. removeMin()
 - 2. _____
 - 3. _____
 - 4. _____
- (b) Fill in the following comparisons with either >, <, or ? if unknown. We recommend considering which elements were compared to reach the final array.
 - 1. X ____ D
 - 2. X ____ C
 - 3. B ____ C
 - 4. G ____ X

3 Hashing Gone Crazy

For this question, use the following TA class for reference.

```
public class TA {
1
            int charisma;
2
            String name;
3
            TA(String name, int charisma) {
                 this.name = name;
                 this.charisma = charisma;
            }
            @Override
            public boolean equals(Object o) {
                TA other = (TA) o;
                 return other.name.charAt(0) == this.name.charAt(0);
11
12
            @Override
            public int hashCode() {
14
                 return charisma;
            }
16
        }
17
```

Assume that the hashCode of a TA object returns charisma, and the equals method returns true if and only if two TA objects have the same first letter in their name.

Assume that the ECHashMap is a HashMap implemented with external chaining as depicted in lecture. The ECHashMap instance begins at size 4 and, for simplicity, does not resize. Draw the contents of map after the executing the insertions below:

```
ECHashMap<TA, Integer> map = new ECHashMap<>();
        TA sohum = new TA("Sohum", 10);
2
        TA vivant = new TA("Vivant", 20);
        map.put(sohum, 1);
        map.put(vivant, 2);
        vivant.charisma += 2;
        map.put(vivant, 3);
        sohum.name = "Vohum";
10
        map.put(vivant, 4);
11
        sohum.charisma += 2;
13
        map.put(sohum, 5);
15
        sohum.name = "Sohum";
16
        TA shubha = new TA("Shubha", 24);
17
        map.put(shubha, 6);
18
```

4 Buggy Hash

The following classes may contain a bug in one of its methods. Identify those errors and briefly explain why they are incorrect and in which situations would the bug cause problems.

```
class Timezone {
            String timeZone; // "PST", "EST" etc.
            boolean dayLight;
3
            String location;
            . . .
            public int currentTime() {
                // return the current time in that time zone
            public int hashCode() {
                return currentTime();
10
            public boolean equals(Object o) {
12
                Timezone tz = (Timezone) o;
                return tz.timeZone.equals(timeZone);
14
            }
15
        }
16
        class Course {
            int courseCode;
            int yearOffered;
            String[] staff;
            public int hashCode() {
                return yearOffered + courseCode;
            public boolean equals(Object o) {
                Course c = (Course) o;
                return c.courseCode == courseCode;
11
12
            }
        }
13
```
