Claim: The stable marriage algorithm terminates in at most  $n^2 + 1$  days.

Men

worse every day

Women

better every day.

Improvement Lemma: If a woman has a man on a string on day  $j$ , then on every subsequent day she has someone at least as good on a string.

By induction on  $\underline{j}$ .  
 $\underline{j+1}$

Claim: The stable marriage algorithm terminates with a pairing of all  $n$  men and women.

A      B      C      - - -      N  
↑

$\boxed{1}$       ~~2~~      ~~3~~      ~~4~~      ~~5~~      . . .      ~~x~~      N

Theorem: The pairing output by the algorithm is stable.

Assume  $M$  prefers  $W^*$

Show  $W^*$  prefers  $M^*$

---

Assume  $M$  prefers  $W^*$ .

$M$  proposes to  $W^*$  before  $W$ .

$W^*$  rejected  $M$  on some day  
in favor of  $M'$ .

By improvement lemma,  
 $W^*$  likes  $M^*$  at least as  
much as  $M'$ .

$\therefore W^*$  prefers  $M^*$  to  $M$ .

$M$ ,  $W$ )

# Stable Roommates

**Alex:** Brad, Charlie, David  
**Brad:** Charlie, Alex, David  
**Charlie:** Alex, Brad, David  
**David:**

# Optimality

1: B A, C, D    A: 1, 2, 3, 4  
2: A B, D, C    B: 2, 1, 4, 3  
3: D C, A, B    C: 3, 1, 4, 2  
4: A, B, C, D    D: 1, 4, 3, 2

Stable pairings: (A, 1) (B, 2) (C, 3) (D, 4)

(A, 2) (B, 1) (C, 3) (D, 4)

(A, 1) (B, 2) (C, 4) (D, 3)

(A, 2) (B, 1) (C, 4) (D, 3)

man optimal.

woman pessimal.

woman optimal.

Theorem: The pairing produced by stable marriage algorithm is male-optimal

∴ First day that some man, say  $M$ , got rejected by his optimal woman  $w^*$ .

$(M, w)$   
∴  
∴  
∴  
∴

1	A	.	-	..
2	B	-	-	-
3	C	-	-	.
4	D	-	-	-

Run algorithm.

First day: same man  
rejected by his optimal

M rejected by  $w^*$

$\exists$  stable pairing:

Theorem: The pairing produced by stable marriage algorithm is female-pessimal.

$(m, w)$

**Moral: Make the first move!**

# Hospital Residency Match

- Each medical school graduate submits a ranked list of hospitals
- Each hospital submits a ranked list of graduates
- A computer runs a suitable variant of TMA.

# Hospital Residency Match

- Intense competition over short supply of residents
- 1940s – appointments made two years before graduation.
- Medical schools stopped releasing info about students until close to graduation.
- Short fuse offers!
- 1950 centralized system.

# 2 From U.S. Win Nobel in Economics

By CATHERINE RAMPELL

Published: October 15, 2012 |  90 Comments

Two Americans, Alvin E. Roth and Lloyd S. Shapley, were [awarded the Nobel Memorial Prize in Economic Science](#) on Monday for their work on market design and matching theory, which relate to how people and companies find and select one another in everything from marriage to school choice to jobs to organ donations.

 [Enlarge This Image](#)

Their work primarily applies to markets that do not have prices, or at least have strict constraints on prices. The laureates' breakthroughs involve figuring out how to properly assign people and things to stable matches when prices are not available to help buyers and sellers pair up.
