Today

- Clipping
  - Clipping to view volume
  - Clipping arbitrary polygons
- Hidden Surface Removal
  - Z-Buffer
  - BSP Trees
  - Others
Clipping

- Stuff outside view volume should not be drawn
  - Too close: obscures view

- Too far:
  - Complexity
  - Z-buffer problems

- Too high/low/right/left:
  - Memory errors
  - Broken algorithms
  - Complexity
Clipping Line to Line/Plane

Line segment to be clipped
\[ x(t) = a + t(b - a) \]

Line/plane that clips it
\[ \hat{n} \cdot x - \hat{n} \cdot r = 0 \]
Clipping Line to Line/Plane

Line segment to be clipped
\[ \mathbf{x}(t) = \mathbf{a} + t(\mathbf{b} - \mathbf{a}) \]

Line/plane that clips it
\[ \hat{\mathbf{n}} \cdot \mathbf{x} - f = 0 \]
\[ \hat{\mathbf{n}} \cdot (\mathbf{a} + t(\mathbf{b} - \mathbf{a})) - f = 0 \]
\[ \hat{\mathbf{n}} \cdot \mathbf{a} + t(\hat{\mathbf{n}} \cdot (\mathbf{b} - \mathbf{a})) - f = 0 \]
\[ t = \frac{f - \hat{\mathbf{n}} \cdot \mathbf{a}}{\hat{\mathbf{n}} \cdot \mathbf{d}} \]

Clipping Line to Line/Plane

- Segment may be on one side
  \[ t \not\in [0\ldots1] \]
- Lines may be parallel
  \[ \hat{\mathbf{n}} \cdot \mathbf{d} = 0 \]
Clipping Line to Line/Plane

- Segment may be on one side
  \[ t \notin [0 \ldots 1] \]
- Lines may be parallel
  \[ \hat{n} \cdot d = 0 \]

\[ \hat{n} \cdot d \leq \varepsilon \] (Recall comments about numerical issues)

Polygon Clip to Convex Domain

- Convex domain defined by collection of planes (or lines or hyper-planes)
- Planes have outward pointing normals
- Clip against each plane in turn
- Check for early/trivial rejection
Polygon Clip to Convex Domain

Inside Outside
s p Output p

Inside Outside
s p Output i

Inside Outside
s p No output

Inside Outside
p i s Output i and p
Polygon Clip to Convex Domain

- Sutherland-Hodgman algorithm
  - Basically edge walking
- Clipping done often... should be efficient
  - Liang-Barsky parametric space algorithm
  - See text for clipping in 4D homogenized coordinates

General Polygon Clipping

\[ A \setminus B \]
\[ B \setminus A \]
\[ A \cup B \]
\[ A \cap B \]
General Polygon Clipping

- Weiler Algorithm
  - Double edges

Hidden Surface Removal

- True 3D to 2D projection would put every thing overlapping into the view plane.
- We need to determine what’s in front and display only that.
Z-Buffers

- Add extra depth channel to image
- Write Z values when writing pixels
- Test Z values before writing

Images from Gihan Arikan

Z-Buffers

- Benefits
  - Easy to implement
  - Works for most any geometric primitive
  - Parallel operation in hardware

- Limitations
  - Quantization and aliasing artifacts
  - Overfill
  - Transparency does not work well
Z-Buffers

- Transparency requires partial sorting:

- Partially transparent
- Opaque
- Opaque

Good

Not Good

Recall depth-value distortions.

It's a feature...

More resolution near viewer

Best use of limited precision
A-Buffers

- Store sorted list of “fragments” at each pixel
- Draw all opaque stuff first then transparent
- Stuff behind full opacity gets ignored

- Nice for antialiasing...

Scan-line Algorithm

- Assume polygons don’t intersect
- Each time an edge is crossed determine who’s on top

![Scan-line Algorithm Diagram]
Painter’s Algorithm

- Sort Polygons Front-to-Back
  - Draw in order
  - Back-to-Front works also, but wasteful
- How to sort quickly?
- Intersecting polygons?
- Cycles?

BSP-Trees

- Binary Space Partition Trees
  - Split space along planes
  - Allows fast queries of some spatial relations
- Simple construction algorithm
  - Select a plane as sub-tree root
  - Everything on one side to one child
  - Everything on the other side to other child
  - Use random polygon for splitting plane
BSP-Trees
BSP-Trees

Visibility Traversal

- Variation of in-order-traversal
  - Child one
  - Sub-tree root
  - Child two

- Select “child one” based on location of viewpoint
  - Child one on same side of sub-tree root as viewpoint
BSP-Trees
