

## Foundations of Computer Graphics (Spring 2012)

CS 184, Lecture 6: OpenGL 1  
<http://inst.eecs.berkeley.edu/~cs184>

## To Do

- HW 1 due on Thu
- Must find partners for HW 2 (if problems, speak to TAs during section). More difficult than HW 1
- Start thinking (now) about HW 2 *and* HW 3.

## Demo: Surreal (HW 3)

## This Lecture

- Introduction to OpenGL and simple demo code
  - mytest1.cpp ; you compiled mytest3.cpp for HW 0
- I am going to show (maybe write) actual code
  - Online code helps you understand HW 2, HW 3 better
  - ASK QUESTIONS if confused!!
- Simple demo of mytest1
- This lecture deals with very basic OpenGL setup. Next 2 lectures will likely be more interesting

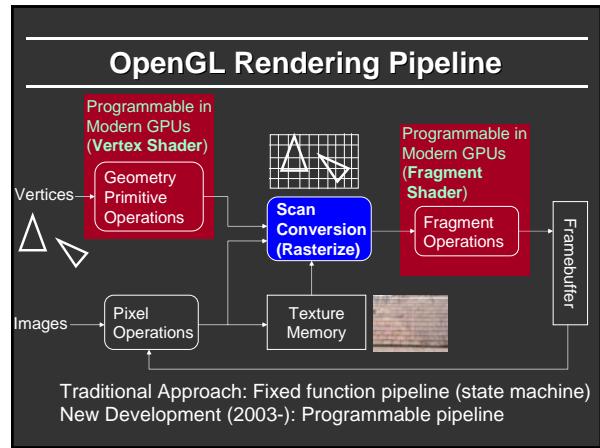

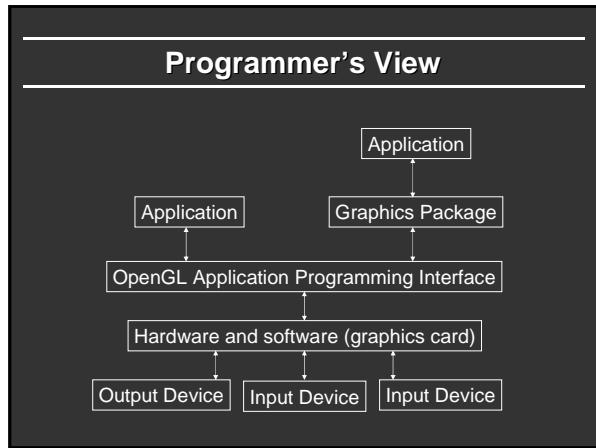

## Outline

- *Basic idea about OpenGL*
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

Best source for OpenGL is the redbook. Of course, this is more a reference manual than a textbook, and you are better off implementing rather reading end to end.

## Introduction to OpenGL

- OpenGL is a graphics API
  - Portable software library (platform-independent)
  - Layer between programmer and graphics hardware
  - Uniform instruction set (hides different capabilities)
- OpenGL can fit in many places
  - Between application and graphics system
  - Between higher level API and graphics system
- Why do we need OpenGL or an API?
  - Encapsulates many basic functions of 2D/3D graphics
  - Think of it as high-level language (C++) for graphics
  - History: Introduced SGI in 92, maintained by Khronos
  - Precursor for DirectX, WebGL, Java3D etc.

- ### GPUs and Programmability
- Since 2003, can write vertex/pixel shaders
  - Fixed function pipeline special type of shader
  - Like writing C programs (see GLSL book)
  - Performance >> CPU (even used for non-graphics)
  - Operate *in parallel* on all vertices or fragments
  - Are teaching CS 184 with programmable shaders

- ### Outline
- Basic idea about OpenGL
  - *Basic setup and buffers*
  - Matrix modes
  - Window system interaction and callbacks
  - Drawing basic OpenGL primitives
  - Initializing Shaders

- ### Buffers and Window Interactions
- Buffers: Color (front, back, left, right), depth (z), accumulation, stencil. When you draw, you write to some buffer (most simply, front and depth)
  - No window system interactions (for portability)
    - But can use GLUT (or Motif, GLX, Tcl/Tk)
    - Callbacks to implement mouse, keyboard interaction

### Basic setup code (you will likely copy)

```

int main(int argc, char** argv)
{
    glutInit(&argc, argv);
    // Requests the type of buffers (Single, RGB).
    // Think about what buffers you would need...
    glutInitDisplayMode (GLUT_SINGLE | GLUT_RGB);

    glutInitWindowSize (500, 500);
    glutInitWindowPosition (100, 100);
    glutCreateWindow ("Simple Demo with Shaders");
    glewInit();
    init(); // Always initialize first

    // Now, we define callbacks and functions for various tasks.
    glutDisplayFunc(display);
    glutReshapeFunc(reshape);
    glutKeyboardFunc(keyboard);
    glutMouseFunc(mouse);
    glutMotionFunc(mousedrag);

    glutMainLoop(); // Start the main code
    return 0; /* ANSI C requires main to return int. */
}
  
```

## Outline

- Basic idea about OpenGL
- Basic setup and buffers
- *Matrix modes*
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- Initializing Shaders

## Viewing in OpenGL

- Viewing consists of two parts
  - Object positioning: *model view* transformation matrix
  - View projection: *projection* transformation matrix
- Old OpenGL (still supported), two matrix stacks
  - GL\_MODELVIEW\_MATRIX, GL\_PROJECTION\_MATRIX
  - Can push and pop matrices onto stacks
- New OpenGL: Use C++ STL templates to make stacks as needed
  - e.g. stack<mat4> modelview ; modelview.push(mat4(1.0)) ;
  - GLM libraries replace many deprecated commands. Include mat4
- OpenGL's camera is always at the origin, pointing in the -z direction
- Transformations move objects relative to the camera
- In old OpenGL, *Matrices are column-major and right-multiply top of stack.* (Last transform in code is first actually applied). In new GLM, it's confusing since matrices are row-order but still right-multiply (read the assignment notes and documentation).

## Basic initialization code for viewing

```
#include <GL/glut.h>
#include <stdlib.h>

int mouseoldx, mouseoldy ; // For mouse motion
GLdouble eyeloc = 2.0 ; // Where to look from; initially 0 -2, 2

void init (void)
{
/* select clearing color      */
    glClearColor (0.0, 0.0, 0.0, 0.0);

/* initialize viewing values */
    glMatrixMode(GL_PROJECTION);
    glLoadIdentity();

// Think about this. Why is the up vector not normalized?
    glMatrixMode(GL_MODELVIEW) ;
    glLoadIdentity();
    gluLookAt(0,-eyeloc,eyeloc,0,0,0,1,1) ;
    // (To be cont'd). Geometry and shader set up later ...
}
```

## Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- *Window system interaction and callbacks*
- Drawing basic OpenGL primitives
- Initializing Shaders

## Window System Interaction

- Not part of OpenGL
- Toolkits (GLUT) available
- Callback functions for events
  - Keyboard, Mouse, etc.
  - Open, initialize, resize window
  - Similar to other systems (X, Java, etc.)
- Our main func included
  - glutDisplayFunc(display);
  - glutReshapeFunc(reshape) ;
  - glutKeyboardFunc(keyboard) ;
  - glutMouseFunc(mouse) ;
  - glutMotionFunc(mousedrag) ;

## Basic window interaction code

```
/* Defines what to do when various keys are pressed */
void keyboard (unsigned char key, int x, int y)
{
    switch (key) {
    case 27: // Escape to quit
        exit(0) ;
        break ;
    default:
        break ;
    }
}

/* Reshapes the window appropriately */
void reshape(int w, int h)
{
    glViewport (0, 0, (GLsizei) w, (GLsizei) h);
    glMatrixMode(GL_PROJECTION);
    glLoadIdentity();

    gluPerspective(30.0, (GLdouble)w/(GLdouble)h, 1.0, 10.0) ;
}
```

## Mouse motion (demo)

```
/* Defines a Mouse callback to zoom in and out */
/* This is done by modifying gluLookAt           */
/* The actual motion is in mousedrag            */
/* mouse simply sets state for mousedrag        */
void mouse(int button, int state, int x, int y)
{
    if (button == GLUT_LEFT_BUTTON) {
        if (state == GLUT_UP) {
            // Do Nothing ;
        }
        else if (state == GLUT_DOWN) {
            mouseoldx = x ; mouseoldy = y ; // so we can move wrt x , y
        }
    }
    else if (button == GLUT_RIGHT_BUTTON && state == GLUT_DOWN)
    { // Reset gluLookAt
        eyeloc = 2.0 ;
        glMatrixMode(GL_MODELVIEW) ;
        glLoadIdentity() ;
        gluLookAt(0,-eyeloc,eyeloc,0,0,0,1,1) ;
        glutPostRedisplay() ;
    }
}
```

## Mouse drag (demo)

```
void mousedrag(int x, int y) {
    int yloc = y - mouseoldy ; // We will use the y coord
    to zoom in/out
    eyeloc += 0.005*yloc ; // Where do we look from
    if (eyeloc < 0) eyeloc = 0.0 ;
    mouseoldy = y ;

    /* Set the eye location */
    glMatrixMode(GL_MODELVIEW) ;
    glLoadIdentity() ;
    gluLookAt(0,-eyeloc,eyeloc,0,0,0,1,1) ;

    glutPostRedisplay() ;
}
```

## Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- *Drawing basic OpenGL primitives*
- Initializing Shaders

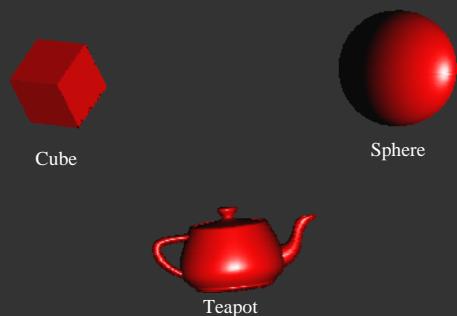

## OpenGL Primitives

## Geometry

- Points (GL\_POINTS)  
Stored in Homogeneous coordinates
- Line segments (GL\_LINES)
- Polygons
  - Simple, convex (take your chances with concave)
  - Tessellate, GLU for complex shapes
  - Rectangles: glColor
- Special cases (strips, loops, triangles, fans, quads)
- More complex primitives (GLUT): Sphere, teapot, cube,...

## GLUT 3D Primitives

## Old OpenGL: Drawing

- Enclose vertices between glBegin() ... glEnd() pair
  - Can include normal C code and attributes like the colors
  - Inside are commands like glVertex3f, glColor3f
  - Attributes must be set **before** the vertex
- Assembly line (pass vertices, transform, shade)
  - These are vertex, fragment shaders on current GPUs
  - Immediate Mode*: Sent to server and drawn
- Client-Server model (client generates vertices, server draws) even if on same machine
  - glFlush() forces client to send network packet
  - glFinish() waits for ack, sparingly use synchronization
- New OpenGL: **Vertex Buffer Objects** (next)

## Old OpenGL: Specifying Geometry

```
glBegin(GL_POLYGON); // Chapter 2 but I do Counter Clock W
```

- glVertex2f (4.0, 0.0);
- glVertex2f (6.0, 1.5);
- glVertex2f (4.0, 3.0);
- glVertex2f (0.0, 3.0);
- glVertex2f (0.0, 0.0);
- // glColor, glIndex, glNormal, glTexCoord, ... (pp 51,52)
- // glMaterial, glArrayElement, glEvalCoord, ... (pp 51,52)
- // Other GL commands invalid between begin and end
- // Can write normal C code...

```
glEnd();
```

## Old OpenGL: Drawing in Display

```
void display(void)
{
    glClear (GL_COLOR_BUFFER_BIT);

    // draw polygon (square) of unit length centered at the origin
    // This code draws each vertex in a different color.
    // The hardware will blend between them.
    // This is a useful debugging trick. I make sure each vertex
    // appears exactly where I expect it to appear.

    glBegin(GL_POLYGON);
        glColor3f (1.0, 0.0, 0.0);
        glVertex3f (0.5, 0.5, 0.0);
        glColor3f (0.0, 1.0, 0.0);
        glVertex3f (-0.5, 0.5, 0.0);
        glColor3f (0.0, 0.0, 1.0);
        glVertex3f (-0.5, -0.5, 0.0);
        glColor3f (1.0, 1.0, 1.0);
        glVertex3f (0.5, -0.5, 0.0);
    glEnd();
    glFlush () ;
}
```

## Modern OpenGL: Floor Specification

```
const GLfloat floorverts[4][3] = {
    {0.5, 0.5, 0.0}, {-0.5, 0.5, 0.0}, {-0.5, -0.5, 0.0}, {0.5, -0.5, 0.0}
};

const GLfloat floorcols[4][3] = {
    {1.0, 0.0, 0.0}, {0.0, 1.0, 0.0}, {0.0, 0.0, 1.0}, {1.0, 1.0, 1.0}
};

const GLubyte floorinds[1][4] = { {0, 1, 2, 3} };

const GLfloat floorverts2[4][3] = {
    {0.5, 0.5, 1.0}, {-0.5, 0.5, 1.0}, {-0.5, -0.5, 1.0}, {0.5, -0.5, 1.0}
};

const GLfloat floorcols2[4][3] = {
    {1.0, 0.0, 0.0}, {1.0, 0.0, 0.0}, {1.0, 0.0, 0.0}, {1.0, 0.0, 0.0}
};

const GLubyte floorinds2[1][4] = { {0, 1, 2, 3} };
```

## Modern OpenGL: Vertex Buffer Objects

```
const int numobjects = 2; // number of objects for buffer
const int numperobj = 3; // Vertices, colors, indices
GLuint buffers[numperobj]; // List of buffers for geometric data
GLuint objects[numobjects]; // For each object
GLenum PrimType[numobjects]; // Primitive Type (quads, polygons)
GLsizei NumElems[numobjects]; // Number of geometric elements

// Floor Geometry is specified with a vertex array
// The Buffer Offset Macro is from Red Book, page 103, 106
// Note for more complex objects the indices must be integers,
// not bytes.

#define BUFFER_OFFSET(bytes) ((GLubyte *) NULL + (bytes))
#define NumberOf(array) (sizeof(array)/sizeof(array[0]))
enum {Vertices, Colors, Elements}; // For arrays for object
enum {FLOOR, FLOOR2}; // For objects, for the floor
```

## Modern OpenGL: Initialize Buffers

```
void initobject (GLuint object, GLfloat * vert, GLint sizevert, GLfloat * col,
                GLint sizecol, GLubyte * inds, GLint sizeind, GLenum type)
{
    int offset = object * numperobj;
    glBindBuffer(GL_ARRAY_BUFFER, buffers[Vertices+offset]);
    glBufferData(GL_ARRAY_BUFFER, sizevert, vert, GL_STATIC_DRAW);
    glVertexAttribPointer(3, GL_FLOAT, 0, BUFFER_OFFSET(0));
    glEnableClientState(GL_VERTEX_ARRAY);
    glBindBuffer(GL_ARRAY_BUFFER, buffers[Colors+offset]);
    glBufferData(GL_ARRAY_BUFFER, sizecol, col, GL_STATIC_DRAW);
    glColorPointer(3, GL_FLOAT, 0, BUFFER_OFFSET(0));
    glEnableClientState(GL_COLOR_ARRAY);
    glBindBuffer(GL_ELEMENT_ARRAY_BUFFER, buffers[Elements+offset]);
    glBufferData(GL_ELEMENT_ARRAY_BUFFER, sizeind, inds, GL_STATIC_DRAW);
    PrimType[object] = type;
    NumElems[object] = sizeind;
}
```

## Modern OpenGL: Draw Vertex Object

```

void drawobject(GLuint object) {
    int offset = object * numperobj ;
    glBindBuffer(GL_ARRAY_BUFFER, buffers[Vertices+offset]) ;
    glVertexPointer(3, GL_FLOAT, 0, BUFFER_OFFSET(0)) ;
    glEnableClientState(GL_VERTEX_ARRAY) ;
    glBindBuffer(GL_ARRAY_BUFFER, buffers[Colors+offset]) ;
    glColorPointer(3, GL_FLOAT, 0, BUFFER_OFFSET(0)) ;
    glEnableClientState(GL_COLOR_ARRAY) ;
    glBindBuffer(GL_ELEMENT_ARRAY_BUFFER,
buffers[Elements+offset]) ;
    glDrawElements(PrimType[object], NumElems[object],
GL_UNSIGNED_BYTE, BUFFER_OFFSET(0)) ;
}
void display(void) {
    glClear (GL_COLOR_BUFFER_BIT);
    drawobject(FLOOR) ; drawobject(FLOOR2)
    glFlush () ; }

```

## Initialization for Drawing, Shading

```

#include "shaders.h"
GLuint vertexshader, fragmentshader, shaderprogram ; // shaders

// Initialization in init() for Drawing
 glGenBuffers(numperobj*numobjects, buffers) ;

initobject(FLOOR, (GLfloat *) floorverts, sizeof(floorverts),
(GLfloat *) floorcol, sizeof(floorcol), (GLubyte *) floorinds,
sizeof(floorinds), GL_POLYGON) ;
initobject(FLOOR2, (GLfloat *) floorverts2,
(GLfloat *) floorcol2, sizeof (floorcol2),
(GLubyte *) floorinds2, sizeof (floorinds2), GL_POLYGON) ;

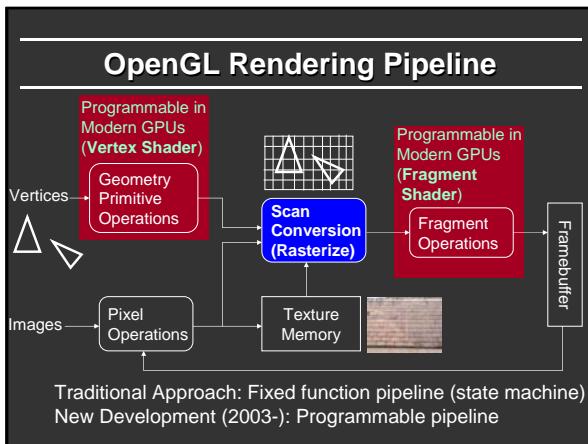

// In init() for Shaders, discussed next
vertexshader = initshaders(GL_VERTEX_SHADER,
"shaders/nop.vert") ;
fragmentshader = initshaders(GL_FRAGMENT_SHADER,
"shaders/nop.frag") ;
shaderprogram = initprogram(vertexshader, fragmentshader) ,

```

## Demo (change colors)

## Outline

- Basic idea about OpenGL
- Basic setup and buffers
- Matrix modes
- Window system interaction and callbacks
- Drawing basic OpenGL primitives
- *Initializing Shaders*

## Simplified OpenGL Pipeline

- User specifies vertices (vertex buffer object)
- For each vertex in parallel
  - OpenGL calls user-specified vertex shader: Transform vertex (ModelView, Projection), other ops
- For each primitive, OpenGL rasterizes
  - Generates a *fragment* for each pixel the fragment covers
- For each fragment in parallel
  - OpenGL calls user-specified fragment shader: Shading and lighting calculations
  - OpenGL handles z-buffer depth test unless overwritten
- Modern OpenGL is “lite” basically just a rasterizer
  - “Real” action in user-defined vertex, fragment shaders

## Shader Setup

- Initializing (shader itself discussed later)
- 1. Create shader (Vertex and Fragment)
- 2. Compile shader
- 3. Attach shader to program
- 4. Link program
- 5. Use program
- Shader source is just sequence of strings
- Similar steps to compile a normal program

## Shader Initialization Code

```
GLuint initshaders (GLenum type, const char *filename) {
    // Using GLSL shaders, OpenGL book, page 679
    GLuint shader = glCreateShader(type);
    GLint compiled;
    string str = textFileRead (filename);
    GLchar * cstr = new GLchar[str.size() + 1];
    const GLchar * cstr2 = cstr; // Weirdness to get a const char
    strcpy(cstr,str.c_str());
    glShaderSource (shader, 1, &cstr2, NULL);
    glCompileShader (shader);
    glGetShaderiv (shader, GL_COMPILE_STATUS, &compiled);
    if (!compiled) {
        shadererrors (shader);
        throw 3;
    }
    return shader;
}
```

## Linking Shader Program

```
GLuint initprogram (GLuint vertexshader, GLuint fragmentshader)
{
    GLuint program = glCreateProgram();
    GLint linked;
    glAttachShader(program, vertexshader);
    glAttachShader(program, fragmentshader);
    glLinkProgram(program);
    glGetProgramiv(program, GL_LINK_STATUS, &linked);
    if (linked) glUseProgram(program);
    else {
        programerrors(program);
        throw 4;
    }
    return program;
}
```

## Basic (nop) vertex shader

- In shaders/ nop.vert.glsl nop.frag.glsl
  - Written in GLSL (GL Shading Language)
  - Vertex Shader (out values interpolated to fragment)
- ```
# version 120
// Mine is an old machine. For version 130 or higher, do
// out vec4 color;
// That is certainly more modern
varying vec4 color;

void main()
{
    gl_Position = gl_ProjectionMatrix * gl_ModelViewMatrix * gl_Vertex;
    color = gl_Color;
}
```

## Basic (nop) fragment shader

```
# version 120

// Mine is an old machine. For version 130 or higher, do
// in vec4 color;
// That is certainly more modern

attribute vec4 color;

void main (void)
{
    gl_FragColor = color;
}
```
