CS188 Outline

- We're done with Part I: Search and Planning!
- Part II: Probabilistic Reasoning
 - Diagnosis
 - Speech recognition
 - Tracking objects
 - Robot mapping
 - Genetics
 - Error correcting codes
 - ... lots more!
- Part III: Machine Learning

Today

- Probability
 - Random Variables
 - Joint and Marginal Distributions
 - Conditional Distribution
 - Product Rule, Chain Rule, Bayes' Rule
 - Inference
 - Independence
- You'll need all this stuff A LOT for the next few weeks, so make sure you go over it now!

CS 188: Artificial Intelligence

Instructors: Dan Klein and Pieter Abbeel --- University of California, Berkeley

[These slides were created by Dan Klein and Pieter Abbeel for CS188 Intro to Al at UC Berkeley. All CS188 materials are available at http://ai.berkeley.edu.]

Inference in Ghostbusters

- A ghost is in the grid somewhere
- Sensor readings tell how close a square is to the ghost
 - On the ghost: red
 - 1 or 2 away: orange
 - 3 or 4 away: yellow
 - 5+ away: green
 - Sensors are noisy, but we know P(Color | Distance)
 - P(red | 3) P(orange | 3) P(yellow | 3) P(green | 3) 0.05 0.15

[Demo: Ghostbuster - no probability (L12D1)]

Uncertainty

General situation:

- Observed variables (evidence): Agent knows certain things about the state of the world (e.g., sensor readings or symptoms)
- Unobserved variables: Agent needs to reason about other aspects (e.g. where an object is or what disease is present)
- Model: Agent knows something about how the known variables relate to the unknown variables
- Probabilistic reasoning gives us a framework for managing our beliefs and knowledge

Probability Distributions

- Associate a probability with each value
 - Temperature:

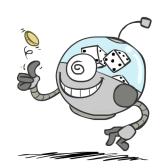

Weather:

Random Variables

- A random variable is some aspect of the world about which we (may) have uncertainty
 - R = Is it raining?
 - T = Is it hot or cold?
 - D = How long will it take to drive to work?
 - L = Where is the ghost?
- We denote random variables with capital letters
- Like variables in a CSP, random variables have domains
 - R in {true, false} (often write as {+r, -r})
 - T in {hot, cold}
 - D in [0, ∞)
 - L in possible locations, maybe {(0,0), (0,1), ...}

Probability Distributions

Unobserved random variables have distributions

| | P(Z) | Γ) |
|---|------|-----|
| l | T | Р |
| | hot | 0.5 |
| | cold | 0.5 |

| P(W) | | |
|--------|-----|--|
| W | Р | |
| sun | 0.6 | |
| rain | 0.1 | |
| fog | 0.3 | |
| meteor | 0.0 | |

Shorthand notation:

$$P(hot) = P(T = hot),$$

 $P(cold) = P(T = cold),$
 $P(rain) = P(W = rain),$
...

OK if all domain entries are unique

- A distribution is a TABLE of probabilities of values
- A probability (lower case value) is a single number

$$P(W = rain) = 0.1$$

• Must have:
$$\forall x \ P(X=x) \geq 0$$
 and $\sum_x P(X=x) = 1$

Joint Distributions

A joint distribution over a set of random variables: X₁, X₂,... X_n specifies a real number for each assignment (or outcome):

$$P(X_1 = x_1, X_2 = x_2, \dots X_n = x_n)$$

 $P(x_1, x_2, \dots x_n)$

• Must obey: $P(x_1, x_2, \dots x_n) \geq 0$

$$\sum_{(x_1, x_2, \dots x_n)} P(x_1, x_2, \dots x_n) = 1$$

P(T,W)

| Т | W | Р |
|------|------|-----|
| hot | sun | 0.4 |
| hot | rain | 0.1 |
| cold | sun | 0.2 |
| cold | rain | 0.3 |

P(T, W)

hot

cold

- Size of distribution if n variables with domain sizes d?
 - For all but the smallest distributions, impractical to write out!

Probabilistic Models

- A probabilistic model is a joint distribution over a set of random variables
- Probabilistic models:
 - (Random) variables with domains
 - Assignments are called outcomes
 - Joint distributions: say whether assignments (outcomes) are likely
 - Normalized: sum to 1.0
 - Ideally: only certain variables directly interact
- Constraint satisfaction problems:
 - Variables with domains
 - Constraints: state whether assignments are possible
 - Ideally: only certain variables directly interact

Distribution over T,W

| Т | W | Р |
|------|------|-----|
| hot | sun | 0.4 |
| hot | rain | 0.1 |
| cold | sun | 0.2 |
| cold | rain | 0.3 |

Constraint over T,W

| Т | W | Р |
|------|------|---|
| hot | sun | Т |
| hot | rain | F |
| cold | sun | F |
| cold | rain | Т |
| | | |

Events

An event is a set E of outcomes

$$P(E) = \sum_{(x_1...x_n) \in E} P(x_1...x_n)$$

- From a joint distribution, we can calculate the probability of any event
 - Probability that it's hot AND sunny?
 - Probability that it's hot?
 - Probability that it's hot OR sunny?
- Typically, the events we care about are partial assignments, like P(T=hot)

■ P(+x, +y) ?

P(+x)?

■ P(-y OR +x) ?

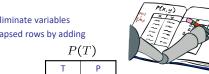

Quiz: Events

| X | Υ | Р |
|----|----|-----|
| +x | +y | 0.2 |
| +x | -у | 0.3 |
| -x | +y | 0.4 |
| -x | -у | 0.1 |

P(X,Y)

Marginal Distributions

- Marginal distributions are sub-tables which eliminate variables
- Marginalization (summing out): Combine collapsed rows by adding

0.6 0.4

| P(T, W) | | | | |
|---------|------|-----|--|--|
| Т | W | Р | | |
| hot | sun | 0.4 | | |
| hot | rain | 0.1 | | |
| cold | sun | 0.2 | | |
| | | | | |

$$P(t) = \sum_{s} P(t, s)$$

$$P(s) = \sum_{t} P(t, s)$$

$$P(X_1 = x_1) = \sum_{x_2} P(X_1 = x_1, X_2 = x_2)$$

Quiz: Marginal Distributions

| P(X,Y) | | | |
|--------|----|-----|--|
| Χ | Υ | Р | |
| +χ | +y | 0.2 | |
| +x | -у | 0.3 | |
| -X | +y | 0.4 | |
| -x | -у | 0.1 | |
| | | | |

$$P(x) = \sum_{y} P(x, y)$$

$$P(y) = \sum_{x} P(x, y)$$

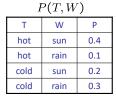

| | P(x,y) |
|---|--------|
| | |
| 1 | |

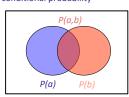

| P(Y) | | |
|------|---|--|
| Υ | Р | |
| +y | | |
| -y | | |

Conditional Probabilities

- A simple relation between joint and conditional probabilities
 - In fact, this is taken as the *definition* of a conditional probability

$$P(a|b) = \frac{P(a,b)}{P(b)}$$

$$P(W = s | T = c) = \frac{P(W = s, T = c)}{P(T = c)} = \frac{0.2}{0.5} = 0.4$$

$$= P(W = s, T = c) + P(W = r, T = c)$$

$$= 0.2 + 0.3 = 0.5$$

Quiz: Conditional Probabilities

| P(X,Y) | | | |
|--------|----|-----|--|
| Χ | Υ | Р | |
| +χ | +y | 0.2 | |
| +χ | -у | 0.3 | |
| -X | +y | 0.4 | |
| -x | -у | 0.1 | |

■ P(+x | +y)?

Conditional Distributions

 Conditional distributions are probability distributions over some variables given fixed values of others

Conditional Distributions

| F | P(W T) | = | colo | Į) |
|---|--------|---|------|----|
| | W | | Р | |
| | | | | |

cold

cold

Normalization Trick

$$P(W = s | T = c) = \frac{P(W = s, T = c)}{P(T = c)}$$

$$= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

$$= \frac{0.2}{0.2 + 0.3} = 0.4$$

$$P(W | T = c)$$

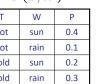

$$= \frac{P(W = r, T = c)}{P(T = c)}$$

$$= \frac{P(W = r, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

Normalization Trick

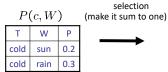

$$\begin{split} P(W = s | T = c) &= \frac{P(W = s, T = c)}{P(T = c)} \\ &= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)} \\ &= \frac{0.2}{0.2 + 0.3} = 0.4 \end{split}$$

P(T,W)W hot sun 0.4 rain 0.1 cold sun 0.2 cold

NORMALIZE the

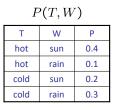

$$P(W|T=c)$$

$$\begin{array}{|c|c|}\hline W & P \\\hline sun & 0.4 \\\hline rain & 0.6 \\\hline \end{array}$$

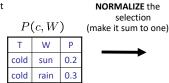

$$\begin{split} P(W=r|T=c) &= \frac{P(W=r,T=c)}{P(T=c)} \\ &= \frac{P(W=r,T=c)}{P(W=s,T=c) + P(W=r,T=c)} \\ &= \frac{0.3}{0.2 + 0.3} = 0.6 \end{split}$$

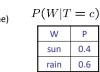

Normalization Trick

 $=\frac{0.3}{0.2+0.3}=0.6$

Р

Why does this work? Sum of selection is P(evidence)! (P(T=c), here)

$$P(x_1|x_2) = \frac{P(x_1, x_2)}{P(x_2)} = \frac{P(x_1, x_2)}{\sum_{x_1} P(x_1, x_2)}$$

Quiz: Normalization Trick

■ P(X | Y=-y)?

P(X,Y)

| Χ | Υ | Р |
|----|----|-----|
| +x | +y | 0.2 |
| +χ | -у | 0.3 |
| -x | +y | 0.4 |
| -X | -у | 0.1 |
| | | |

SELECT the joint probabilities matching the evidence

NORMALIZE the selection (make it sum to one)

Probabilistic Inference

- Probabilistic inference: compute a desired probability from other known probabilities (e.g. conditional from joint)
- We generally compute conditional probabilities
 - P(on time | no reported accidents) = 0.90
 - These represent the agent's beliefs given the evidence
- Probabilities change with new evidence:
 - P(on time | no accidents, 5 a.m.) = 0.95
 - P(on time | no accidents, 5 a.m., raining) = 0.80
 - Observing new evidence causes beliefs to be updated

To Normalize

(Dictionary) To bring or restore to a normal condition

- Procedure:
 - Step 1: Compute Z = sum over all entries
 - Step 2: Divide every entry by Z

Example 1

| W | Р | Normalize | W | Р |
|------|-----|---------------|------|-----|
| sun | 0.2 | \rightarrow | sun | 0.4 |
| rain | 0.3 | Z = 0.5 | rain | 0.6 |

Example 2

| Т | W | Р | | Т | W |
|------|------|----|-------------|------|------|
| hot | sun | 20 | Normalize | hot | sun |
| hot | rain | 5 | | hot | rain |
| cold | sun | 10 | Z = 50 | cold | sun |
| cold | rain | 15 | | cold | rain |
| | | | | | |

Inference by Enumeration

 $X_1, X_2, \dots X_n$

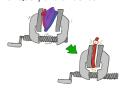

All variables

- General case:
 - Evidence variables:

Step 1: Select the entries consistent with the evidence

Step 2: Sum out H to get joint of Query and evidence

$$P(Q, e_1 \dots e_k) = \sum_{h_1 \dots h_r} P(Q, h_1 \dots h_r, e_1 \dots e_k)$$

$$X_1, X_2, \dots X_n$$

$$Z = \sum_q P(Q, e_1 \dots e_k)$$

$$P(Q|e_1 \dots e_k) = \frac{1}{Z} P(Q, e_1 \dots e_k)$$

 $E_1 \dots E_k = e_1 \dots e_k$

- We want:
- * Works fine with multiple query variables, too

Р 0.4 0.1

0.2

0.3

$$P(Q|e_1 \dots e_k)$$

Step 3: Normalize

$$\times \frac{1}{Z}$$

$$Z = \sum_{q} P(Q, e_1 \cdots e_k)$$

$$P(Q|e_1 \cdots e_k) = \frac{1}{Z} P(Q, e_1 \cdots e_k)$$

Inference by Enumeration

P(W)?

P(W | winter)?

P(W | winter, hot)?

| S | Т | W | Р |
|--------|------|------|------|
| summer | hot | sun | 0.30 |
| summer | hot | rain | 0.05 |
| summer | cold | sun | 0.10 |
| summer | cold | rain | 0.05 |
| winter | hot | sun | 0.10 |
| winter | hot | rain | 0.05 |
| winter | cold | sun | 0.15 |
| winter | cold | rain | 0.20 |

The Product Rule

Sometimes have conditional distributions but want the joint

$$P(y)P(x|y) = P(x,y)$$
 \Leftrightarrow $P(x|y) = \frac{P(x,y)}{P(y)}$

$$P(x|y) = \frac{P(x,y)}{P(y)}$$

Inference by Enumeration

- Obvious problems:
 - Worst-case time complexity O(dⁿ)
 - Space complexity O(dⁿ) to store the joint distribution

The Product Rule

$$P(y)P(x|y) = P(x,y)$$

Example:

P(W)

| P(D W) | | | |
|--------|-----|------|-----|
| | D | W | Р |
| | wet | sun | 0.1 |
| | dry | sun | 0.9 |
| | wet | rain | 0.7 |
| | dry | rain | 0.3 |

| L |
|---|
| Γ |
| Г |
| Γ |
| Г |

| D | W | Р |
|-----|------|---|
| wet | sun | |
| dry | sun | |
| wet | rain | |
| dry | rain | |

P(D,W)

The Chain Rule

 More generally, can always write any joint distribution as an incremental product of conditional distributions

$$P(x_1, x_2, x_3) = P(x_1)P(x_2|x_1)P(x_3|x_1, x_2)$$

$$P(x_1, x_2, \dots x_n) = \prod_i P(x_i|x_1 \dots x_{i-1})$$

Why is this always true?

Bayes' Rule

Two ways to factor a joint distribution over two variables:

$$P(x,y) = P(x|y)P(y) = P(y|x)P(x)$$

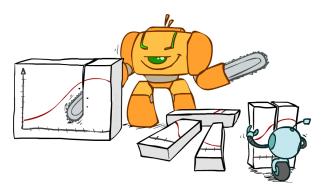

Dividing, we get:

$$P(x|y) = \frac{P(y|x)}{P(y)}P(x)$$

- Why is this at all helpful?
 - Lets us build one conditional from its reverse
 - Often one conditional is tricky but the other one is simple
 - Foundation of many systems we'll see later (e.g. ASR, MT)
- In the running for most important AI equation!

Bayes Rule

Inference with Bayes' Rule

• Example: Diagnostic probability from causal probability:

$$P(\text{cause}|\text{effect}) = \frac{P(\text{effect}|\text{cause})P(\text{cause})}{P(\text{effect})}$$

- Example:
 - M: meningitis, S: stiff neck

$$P(+m) = 0.0001 \\ P(+s|+m) = 0.8 \\ P(+s|-m) = 0.01$$
 Example givens

$$P(+m|+s) = \frac{P(+s|+m)P(+m)}{P(+s)} = \frac{P(+s|+m)P(+m)}{P(+s|+m)P(+m) + P(+s|-m)P(-m)} = \frac{0.8 \times 0.0001}{0.8 \times 0.0001 + 0.01 \times 0.999}$$

- Note: posterior probability of meningitis still very small
- Note: you should still get stiff necks checked out! Why?

Quiz: Bayes' Rule

• Given:

| P(W) | | |
|------|--|--|
| Р | | |
| 0.8 | | |
| 0.2 | | |
| | | |

P(D|W)

| D | W | Р |
|-----|------|-----|
| wet | sun | 0.1 |
| dry | sun | 0.9 |
| wet | rain | 0.7 |
| dry | rain | 0.3 |

■ What is P(W | dry)?

Next Time: Markov Models

Ghostbusters, Revisited

- Let's say we have two distributions:
 - Prior distribution over ghost location: P(G)
 - Let's say this is uniform
 - Sensor reading model: P(R | G)
 - Given: we know what our sensors do
 - R = reading color measured at (1,1)
 - E.g. P(R = yellow | G=(1,1)) = 0.1
- We can calculate the posterior distribution P(G|r) over ghost locations given a reading using Bayes' rule:

$$P(g|r) \propto P(r|g)P(g)$$

[Demo: Ghostbuster – with probability (L12D2)]
