Announcements: Midterm

• This Thursday, October 17, 2024, 7-9 PM PT.

- If you need to take the alternate exam (same day, 9-11 PM PT, in-person only) or if you need DSP accommodations and you have not filled out the alternate exam request form, send us an email at cs188@berkeley.edu immediately.
- Topics:
 - Search, CSPs, Games, MDPs, Reinforcement Learning, and Bayes Nets (only up to representation). These were covered in: Lectures 1-13, Notes 1-6.4, Discussions 1-5, Projects 1-3, and Homeworks 1-5.
- Format:
 - Closed-book, closed-notes, and closed-internet. No calculators are allowed (no questions require a calculator).
 However, you may use 1 cheat sheet (two-sided) of your own design, handwritten or typed.
- Room Assignment: was emailed to you by Saturday, October 12th
 - If you did not receive an email yet, or if you are supposed to be taking an alternate exam and your email did not indicate that, send an email to cs188@berkeley.edu.
 - Please try to arrive early, so that we can start on time.
- Check Ed in case of any further announcements

CS 188: Artificial Intelligence

Bayes' Nets: Independence

Instructors: Pieter Abbeel & Igor Mordatch --- University of California, Berkeley

[Many of these slides were originally created by Dan Klein and Pieter Abbeel for CS188 Intro to AI at UC Berkeley.]

Probability Recap

- Conditional probability $P(x|y) = \frac{P(x,y)}{P(y)}$
- Product rule P(x,y) = P(x|y)P(y)

• Chain rule
$$P(X_1, X_2, \dots, X_n) = P(X_1)P(X_2|X_1)P(X_3|X_1, X_2)\dots$$

 $= \prod_{i=1}^n P(X_i|X_1, \dots, X_{i-1})$

- X, Y independent if and only if: $\forall x, y : P(x, y) = P(x)P(y)$
- X and Y are conditionally independent given Z if and only if:

$$\forall x, y, z : P(x, y|z) = P(x|z)P(y|z) \qquad X \perp Y|Z$$

Bayes' Nets

- A Bayes' net is an efficient encoding of a probabilistic model of a domain
- Questions we can ask:

- Representation: given a BN graph, what kinds of distributions can it encode?
- Inference: given a fixed BN, what is P(X | e)?

Bayes' Net Semantics

- A directed, acyclic graph, one node per random variable
- A conditional probability table (CPT) for each node
 - A collection of distributions over X, one for each combination of parents' values

 $P(X|a_1\ldots a_n)$

- Bayes' nets implicitly encode joint distributions
 - As a product of local conditional distributions
 - To see what probability a BN gives to a full assignment, multiply all the relevant conditionals together:

$$P(x_1, x_2, \dots, x_n) = \prod_{i=1}^n P(x_i | parents(X_i))$$

Example: Alarm Network

$$P(+b, -e, +a, -j, +m) =$$

Example: Alarm Network

Size of a Bayes' Net

- How big is a joint distribution over N Boolean variables?
 - 2^N
- How big is an N-node net if nodes have up to k parents?
 O(N * 2^{k+1})

- Both give you the power to calculate
 - $P(X_1, X_2, \ldots X_n)$
- BNs: Huge space savings!
- Also easier to elicit local CPTs
- Also faster to answer queries (coming)

Bayes' Nets

- Conditional Independences
- Probabilistic Inference
- Learning Bayes' Nets from Data

Conditional Independence

X and Y are independent if

$$\forall x, y \ P(x, y) = P(x)P(y) \ \neg \neg \neg \rightarrow \ X \bot\!\!\!\!\perp Y$$

X and Y are conditionally independent given Z

$$\forall x, y, z \ P(x, y|z) = P(x|z)P(y|z) \dashrightarrow \to X \bot \!\!\!\perp Y|Z$$

- Conditional) independence is a property of a distribution
- Example: $Alarm \perp Fire | Smoke$

Bayes Nets: Assumptions

 Assumptions we are required to make to define the Bayes net when given the graph:

 $P(x_i|x_1\cdots x_{i-1}) = P(x_i|parents(X_i))$

- Beyond above "chain rule → Bayes net" conditional independence assumptions
 - Often additional conditional independences
 - They can be read off the graph
- Important for modeling: understand assumptions made when choosing a Bayes net graph

• Conditional independence assumptions directly from simplifications in chain rule:

Additional implied conditional independence assumptions?

Independence in a BN

- Important question about a BN:
 - Are two nodes independent given certain evidence?
 - If yes, can prove using algebra (tedious in general)
 - If no, can prove with a counter example
 - Example:

- Question: for this BN graph, are X and Z necessarily independent?*
 - Answer: no. Example: low pressure causes rain, which causes traffic.
 - X can influence Z, Z can influence X (via Y)
 - Addendum: they could be independent: how?

* Equivalent phrasing: for this BN graph, are X and Z guaranteed to be independent no matter the choice of CPTs

D-separation

D-separation: Overview

D-separation:

 a condition / algorithm for answering conditional independence queries from just studying the graph

How:

- Study independence properties for triples
- Analyze complex cases as composition of triples

Triple Type 1: Causal Chains

This configuration is a "causal chain"

$$P(x, y, z) = P(x)P(y|x)P(z|y)$$

- Guaranteed X independent of Z ? No!
 - One example set of CPTs for which X is not independent of Z is sufficient to show this independence is not guaranteed.
 - Example:
 - Low pressure causes rain causes traffic, high pressure causes no rain causes no traffic
 - In numbers:

$$P(+y | +x) = 1, P(-y | -x) = 1,$$

 $P(+z | +y) = 1, P(-z | -y) = 1$

Triple Type 1: Causal Chains

This configuration is a "causal chain"

$$P(x, y, z) = P(x)P(y|x)P(z|y)$$

Guaranteed X independent of Z given Y?

$$P(z|x,y) = \frac{P(x,y,z)}{P(x,y)}$$
$$= \frac{P(x)P(y|x)P(z|y)}{P(x)P(y|x)}$$

$$= P(z|y)$$

Yes!

Evidence along the chain "blocks" the influence

Triple Type 2: Common Cause

This configuration is a "common cause"

P(x, y, z) = P(y)P(x|y)P(z|y)

- Guaranteed X independent of Z ? No!
 - One example set of CPTs for which X is not independent of Z is sufficient to show this independence is not guaranteed.
 - Example:
 - Project due causes both forums busy and lab full
 - In numbers:

$$P(+x | +y) = 1, P(-x | -y) = 1,$$

 $P(+z | +y) = 1, P(-z | -y) = 1$

Triple Type 2: Common Cause

This configuration is a "common cause"

P(x, y, z) = P(y)P(x|y)P(z|y)

Guaranteed X and Z independent given Y?

$$P(z|x,y) = \frac{P(x,y,z)}{P(x,y)}$$

 $=\frac{P(y)P(x|y)P(z|y)}{P(y)P(x|y)}$

= P(z|y)

Yes!

 Observing the cause blocks influence between effects.

Triple Type 3: Common Effect

 Last configuration: two causes of one effect (v-structures)

- Are X and Y independent?
 - Yes: the ballgame and the rain cause traffic, but they are not correlated
 - Still need to prove they must be (try it!)
- Are X and Y independent given Z?
 - No: seeing traffic puts the rain and the ballgame in competition as explanation.
- This is backwards from the other cases
 - Observing an effect activates influence between possible causes.

Recap of Triples

The General Case

The General Case

- General question: in a given BN, are two variables independent (given evidence)?
- Solution: analyze the graph
- Each path can be seen as repetitions of the three canonical cases

From Triples to Paths to D-Separation

• A path is active if each (overlapping) triple is active:

Note: e.g. for a path A - B - C - D - E, the triples are:

A - B - C, B - C - D, C - D - E

Note: all it takes to block a path is a single inactive segment

- Are X and Y "D-separated" given evidence variables {Z}?
 - Consider all (undirected) paths from X to Y
 - If none of the paths are active, then X and Y are D-separated given {Z}
 - On the other hand, if there is at least one active path, then X and Y are not D-separated given {Z}
- Independence and D-separation: X and Y are guaranteed conditionally independent given {Z} IF AND ONLY IF X and Y are d-separated given {Z}
 - ightarrow just need to check the graph

 $\begin{array}{ll} R \bot B & \text{Yes} \\ R \bot B | T \\ R \bot B | T' \end{array}$

Variables:

- R: Raining
- T: Traffic
- D: Roof drips
- S: I'm sad
- Questions:
 - $T \! \perp \! D$
 - $T \perp\!\!\!\perp D | R$ Yes $T \perp\!\!\!\perp D | R, S$

Structure Implications

 Given a Bayes net structure, can run dseparation algorithm to build a complete list of conditional independences that are necessarily true of the form

$$X_i \perp \perp X_j | \{X_{k_1}, \dots, X_{k_n}\}$$

This list determines the set of probability distributions that can be represented

Computing All Independences

Topology Limits Distributions

- Given some graph topology
 G, only certain joint
 distributions can be
 encoded
- The graph structure guarantees certain (conditional) independences
- (There might be more independence)
- Adding arcs increases the set of distributions, but has several costs
- Full conditioning can encode any distribution

Bayes Nets Representation Summary

- Bayes nets compactly encode joint distributions
- Guaranteed independencies of distributions can be deduced from BN graph structure
- D-separation gives precise conditional independence guarantees from graph alone
- A Bayes' net's joint distribution may have further (conditional) independence that is not detectable until you inspect its specific distribution

Bayes' Nets

- Representation
- Conditional Independences
 - Probabilistic Inference
 - Enumeration (exact, exponential complexity)
 - Variable elimination (exact, worst-case exponential complexity, often better)
 - Probabilistic inference is NP-complete
 - Sampling (approximate)
 - Learning Bayes' Nets from Data
