Example: Weather HMM

| Rt-1 | Rt | $P(R_t R_{t-1})$ |
|------|----|--------------------|
| +r | +r | 0.7 |
| +r | -r | 0.3 |
| -r | +r | 0.3 |
| -r | -r | 0.7 |

| Rt | Ut | $P(U_t R_t)$ |
|----|----|----------------|
| +r | +u | 0.9 |
| +r | -u | 0.1 |
| -r | +u | 0.2 |
| -r | -u | 0.8 |

Example: Weather HMM

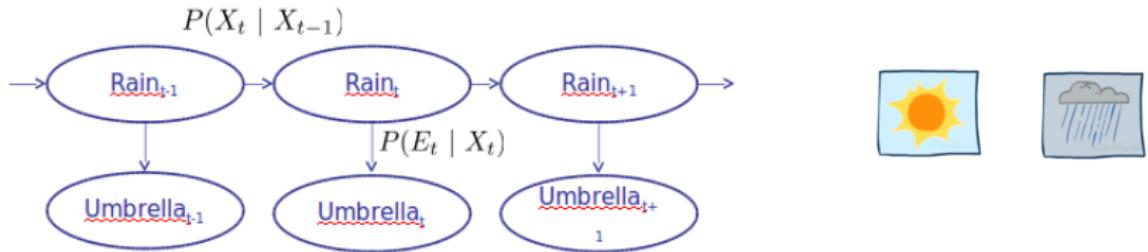

| Rt-1 | Rt | $P(Rt Rt-1)$ |

Filtering / Monitoring

Filtering / Monitoring

Filtering, or monitoring, is the task of tracking the distribution $B_t(X) = P_t(X_t|e_1, \dots, e_t)$ (the belief state) over time

Filtering / Monitoring

Filtering, or monitoring, is the task of tracking the distribution $B_t(X) = P_t(X_t|e_1, \dots, e_t)$ (the belief state) over time

We start with $B_1(X)$ in an initial setting, usually uniform

Filtering / Monitoring

Filtering, or monitoring, is the task of tracking the distribution $B_t(X) = P_t(X_t|e_1, \dots, e_t)$ (the belief state) over time

We start with $B_1(X)$ in an initial setting, usually uniform

As time passes, or we get observations, we update $B(X)$

Filtering / Monitoring

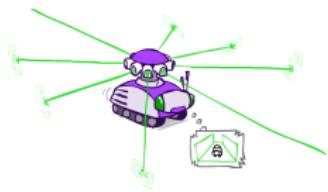

Filtering, or monitoring, is the task of tracking the distribution $B_t(X) = P_t(X_t|e_1, \dots, e_t)$ (the belief state) over time

We start with $B_1(X)$ in an initial setting, usually uniform

The Kalman filter was invented in the 60's and first implemented as a method of trajectory estimation for the Apollo program

Assume we have current belief
 $P(X|\text{previous evidence})$:

$$B'(X_{t+1}) = P(X_{t+1} | e_{1:t})$$

Then, after evidence comes in:

$$\begin{aligned} P(X_{t+1} | e_{1:t+1}) &= P(X_{t+1}, e_{t+1} | e_{1:t}) / P(e_{t+1} | e_{1:t}) \\ &\propto P(e_{t+1} | e_{1:t}, X_{t+1}) P(X_{t+1} | e_{1:t}) \\ &= P(e_{t+1} | X_{t+1}) P(X_{t+1} | e_{1:t}) \end{aligned}$$

Or, compactly: $B(X_{t+1}) \propto P(e_{t+1} | X_{t+1}) B(X_t)$

Basic idea: beliefs “reweighted” by likelihood of evidence

Observation

Assume we have current belief
 $P(X|\text{previous evidence})$:

$$B'(X_{t+1}) = P(X_{t+1}|e_{1:t})$$

Then, after evidence comes in:

$$\begin{aligned}P(X_{t+1}|e_{1:t+1}) &= P(X_{t+1}, e_{t+1}|e_{1:t})/P(e_{t+1}|e_{1:t}) \\&\propto P(e_{t+1}|e_{1:t}, X_{t+1})P(X_{t+1}|e_{1:t}) \\&= P(e_{t+1}|X_{t+1})P(X_{t+1}|e_{1:t})\end{aligned}$$

Or, compactly: $B(X_{t+1}) \propto P(e_{t+1}|X_{t+1})B(X_t)$

Basic idea: beliefs “reweighted” by likelihood of evidence

Unlike passage of time, we have to renormalize

Each particle is moved by sampling its next position from the transition model

- This is like prior sampling – samples' frequencies reflect the transition probabilities
- Here, most samples move clockwise, but some move in another direction or stay in place
