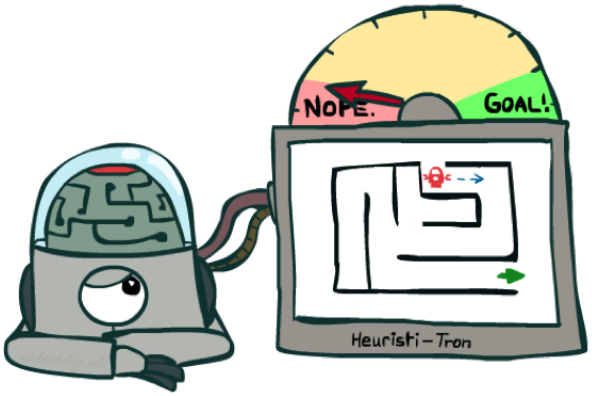
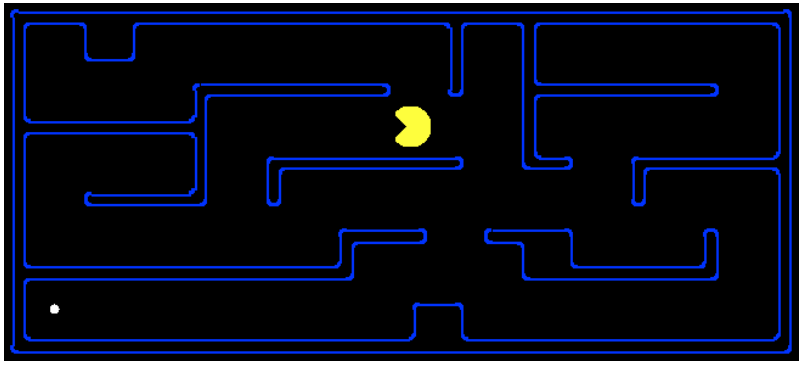
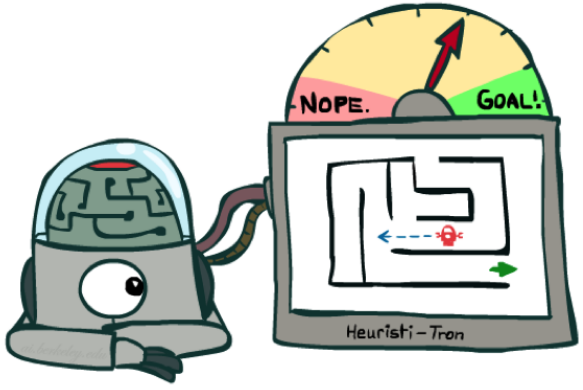
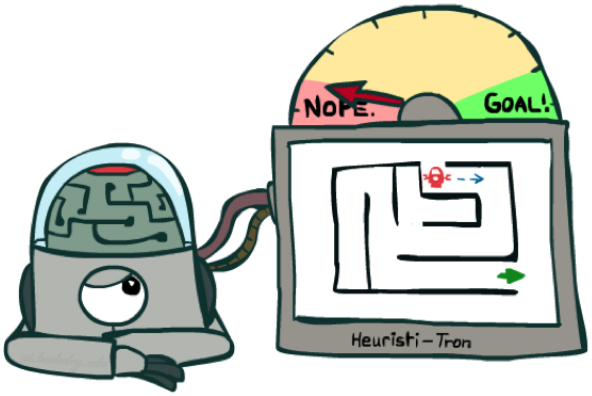
Search Heuristics

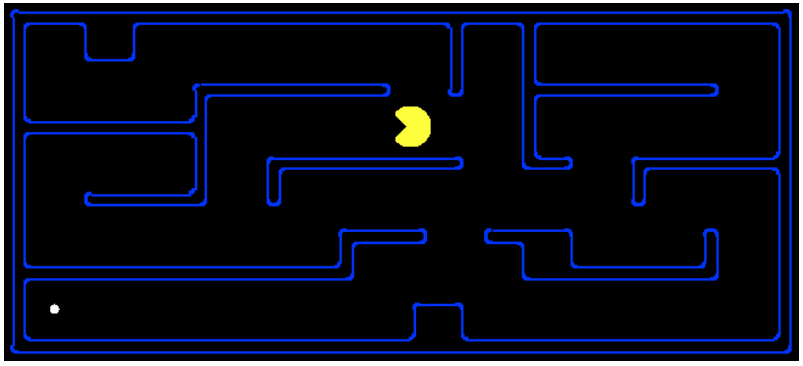


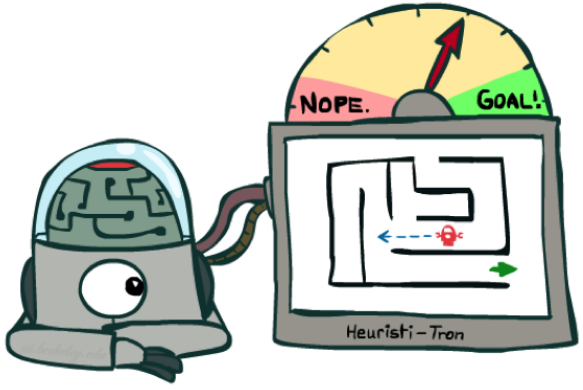




Search Heuristics



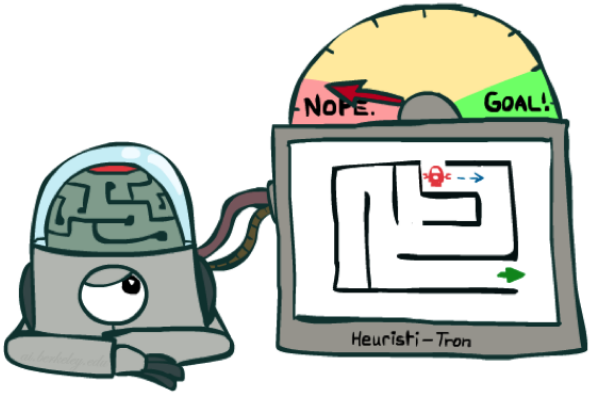


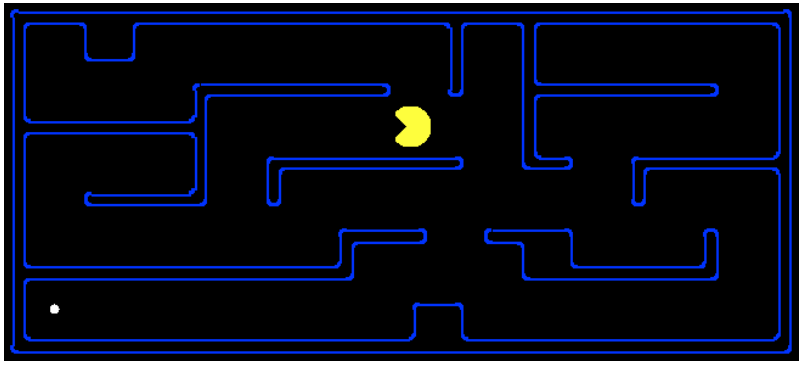


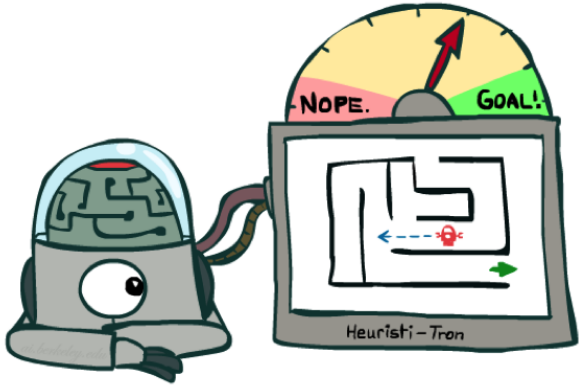
A heuristic is:

- A function that *estimates* how close a state is to a goal
- Designed for a particular search problem

Search Heuristics



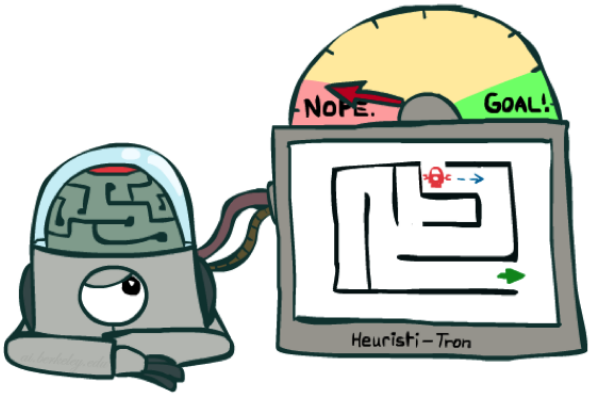


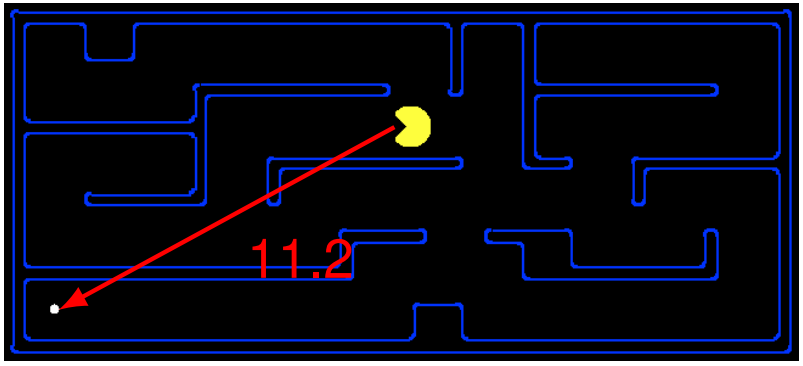


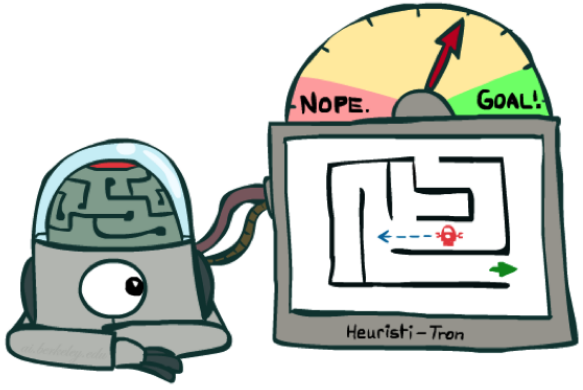
A heuristic is:

- A function that *estimates* how close a state is to a goal
- Designed for a particular search problem
- Examples:

Search Heuristics



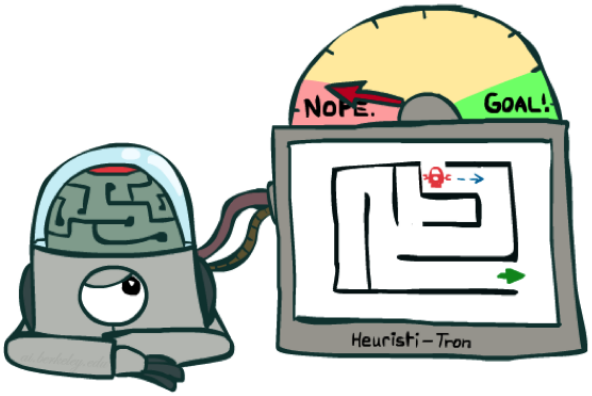


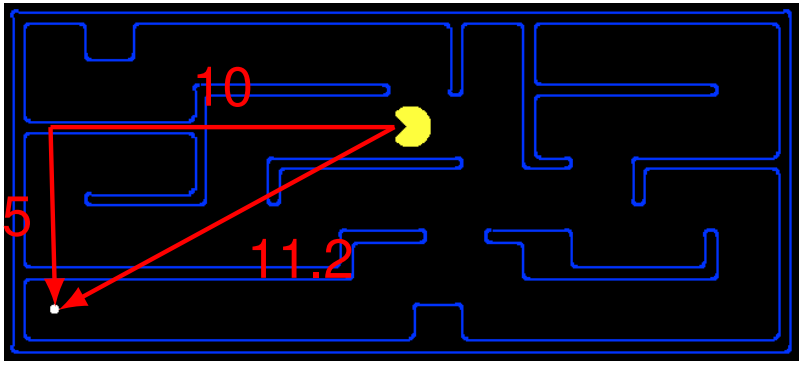


A heuristic is:

- A function that *estimates* how close a state is to a goal
- Designed for a particular search problem
- Examples: Euclidean distance for pathing.

Search Heuristics





A heuristic is:

- A function that *estimates* how close a state is to a goal
- Designed for a particular search problem
- Examples: Euclidean distance for pathing. Manhattan distance.

We need estimates to be less than actual costs!
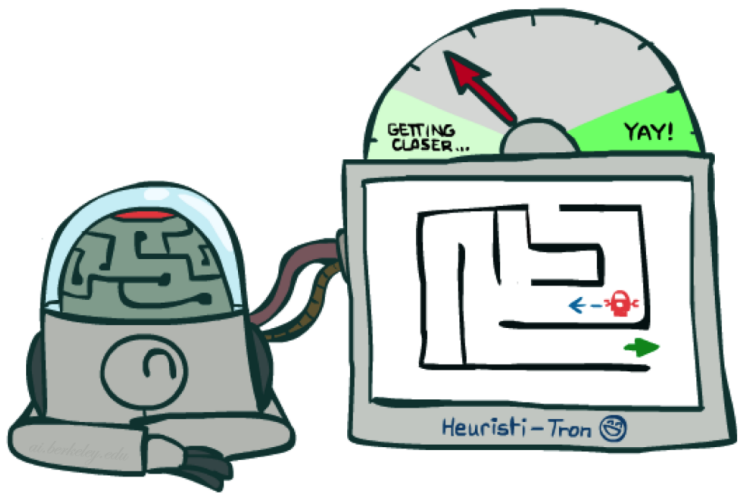
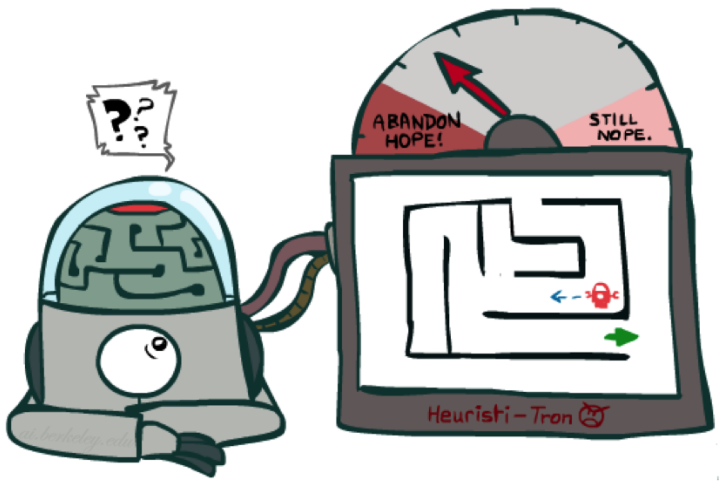
Lower bounds for actual costs.

Admissible Heuristics

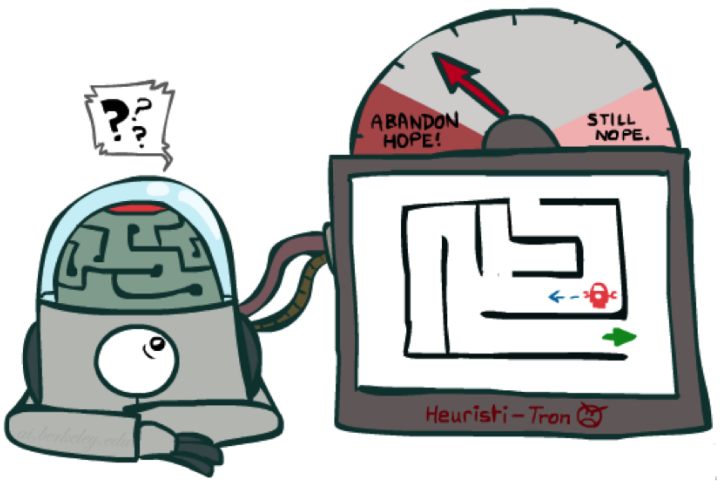


Idea: Admissibility

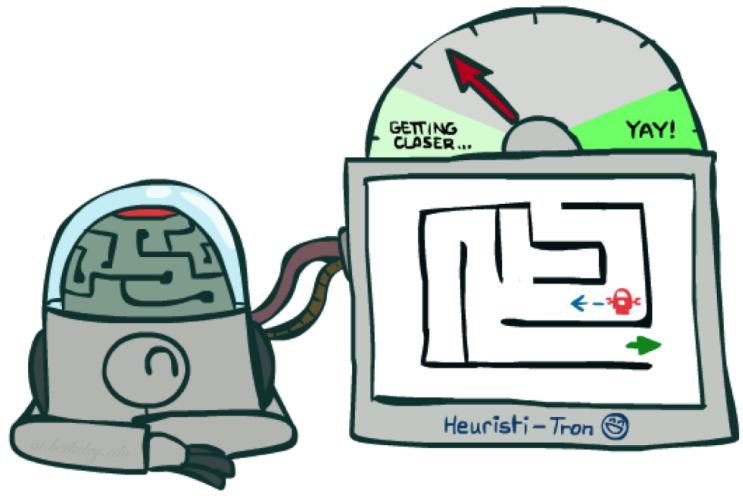


Inadmissible (pessimistic) heuristics break optimality by trapping good plans on the fringe

Idea: Admissibility



Inadmissible (pessimistic) heuristics break optimality by trapping good plans on the fringe



Admissible (optimistic) heuristics slow down bad plans but never outweigh true costs

Admissible Heuristics

A heuristic h is admissible (optimistic) if:

$$0 \leq h(n) \leq h^*(n)$$

where $h^*(n)$ is the true cost to a nearest goal

Admissible Heuristics

A heuristic h is admissible (optimistic) if:

$$0 \leq h(n) \leq h^*(n)$$

where $h^*(n)$ is the true cost to a nearest goal Note: Coming up with admissible heuristics is most of what's involved in using A* in practice.

Admissible Heuristics

A heuristic h is admissible (optimistic) if:

$$0 \leq h(n) \leq h^*(n)$$

where $h^*(n)$ is the true cost to a nearest goal Note: Coming up with admissible heuristics is most of what's involved in using A* in practice.
Examples:

Admissible Heuristics

A heuristic h is admissible (optimistic) if:

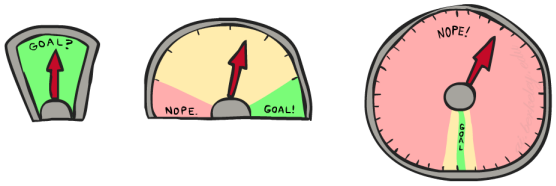
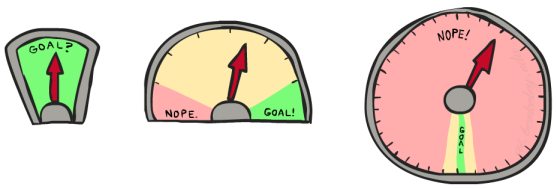
MANHATTAN	12	25	73

8 Puzzle III



How about using the actual cost as a heuristic?

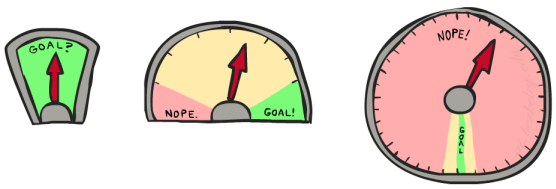
8 Puzzle III



How about using the actual cost as a heuristic?

Would it be admissible?

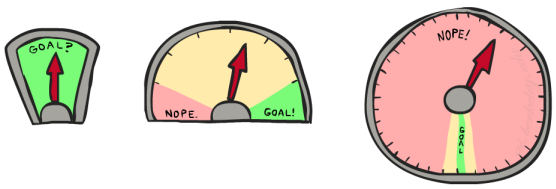
8 Puzzle III



How about using the actual cost as a heuristic?

- Would it be admissible?
- Would we save on nodes expanded?

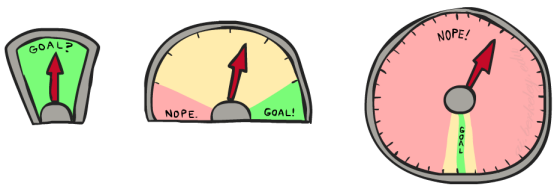
8 Puzzle III



How about using the actual cost as a heuristic?

- Would it be admissible?
- Would we save on nodes expanded?
- What's wrong with it?

8 Puzzle III



How about using the actual cost as a heuristic?

Would it be admissible?

Would we save on nodes expanded?

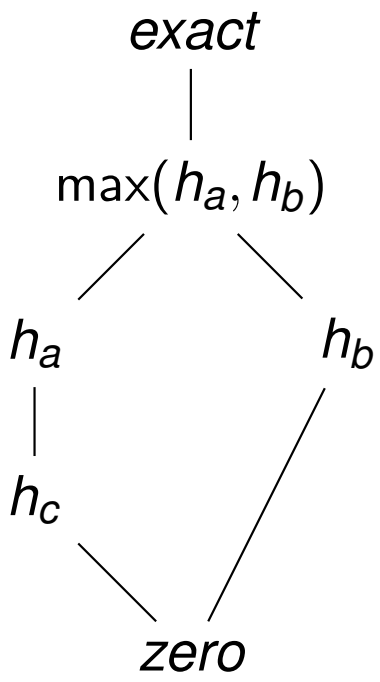
What's wrong with it?

With A*: a trade-off between quality of estimate and work per node

- As heuristics get closer to the true cost, expand fewer nodes, but more work per node to compute the heuristic itself.

Semi-Lattice of Heuristics

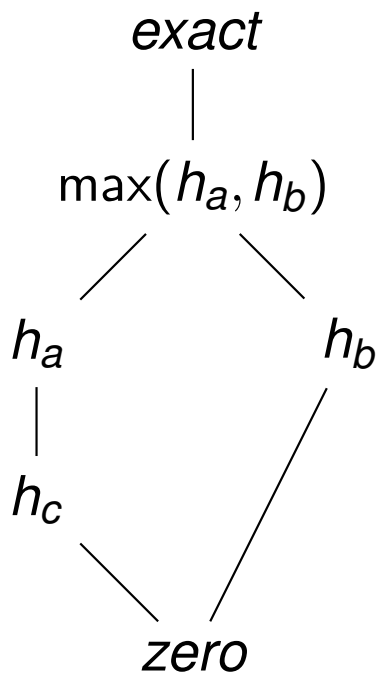
Trivial Heuristics, Dominance



Dominance: $h_a \geq h_c$ if

$$\forall n : h_a(n) \geq h_c(n)$$

Trivial Heuristics, Dominance

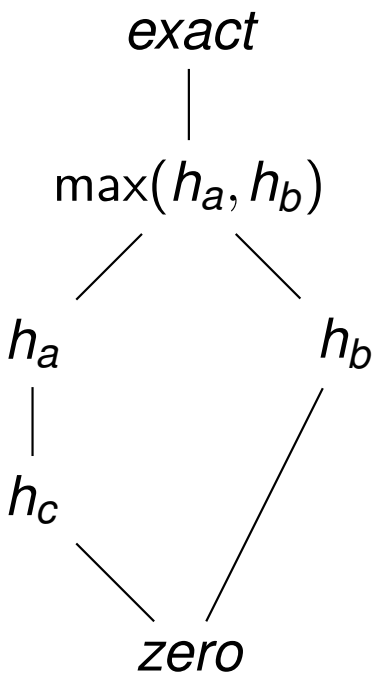


Dominance: $h_a \geq h_c$ if

$$\forall n : h_a(n) \geq h_c(n)$$

Heuristics form a semi-lattice:

Trivial Heuristics, Dominance

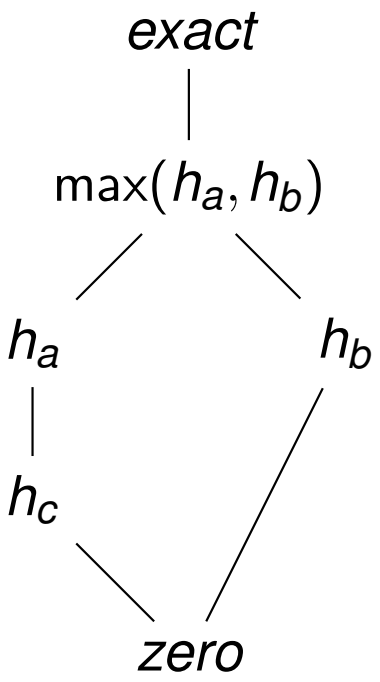


Dominance: $h_a \geq h_c$ if

$$\forall n : h_a(n) \geq h_c(n)$$

Heuristics form a semi-lattice:
Max of admissible heuristics is admissible.

Trivial Heuristics, Dominance



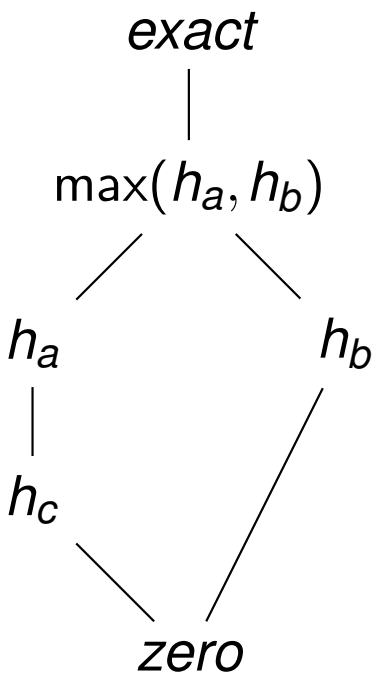
Dominance: $h_a \geq h_c$ if

$$\forall n : h_a(n) \geq h_c(n)$$

Heuristics form a semi-lattice:
Max of admissible heuristics is admissible.

Trivial heuristics

Trivial Heuristics, Dominance



Dominance: $h_a \geq h_c$ if

$$\forall n : h_a(n) \geq h_c(n)$$

Heuristics form a semi-lattice:
Max of admissible heuristics is admissible.

Trivial heuristics
Bottom of lattice is the zero heuristic.

Trivial Heuristics, Dominance

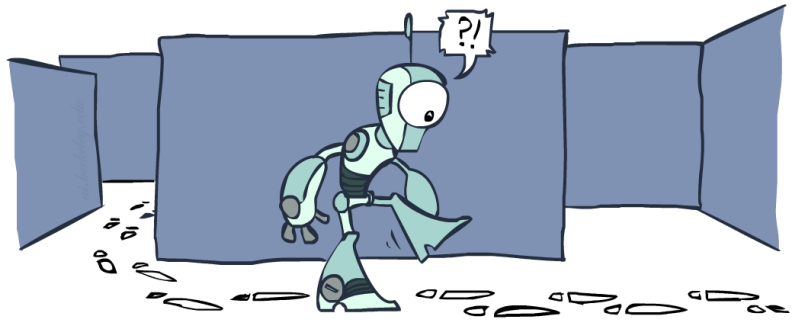
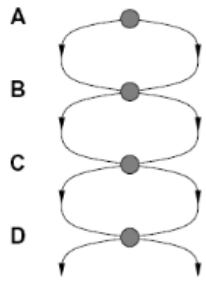
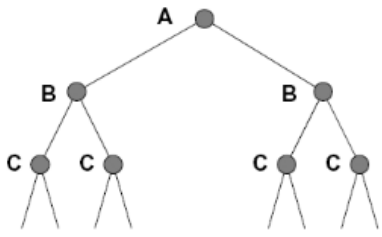
Top of lattice is the exact heuristic

Graph Search



Tree Search: Extra Work!

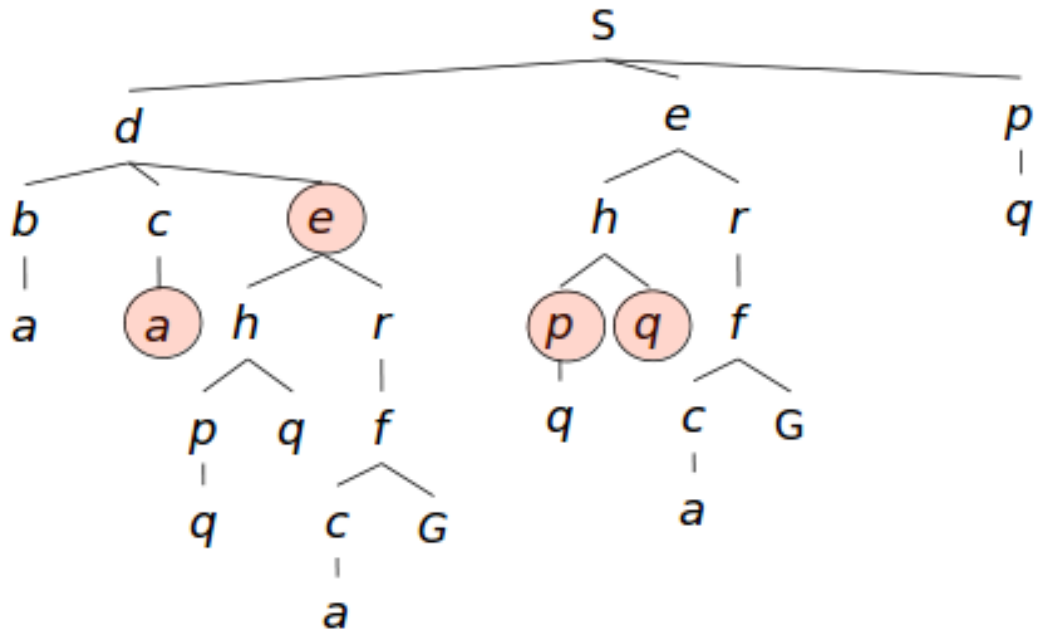




Search Tree
State Graph

Failure to detect repeated states can cause exponentially more work.

Graph Search



In BFS, for example, we shouldn't bother expanding the circled nodes (why?)

Graph Search

Idea: never expand a state twice

Graph Search

Idea: never expand a state twice

How to implement:

Graph Search

Idea: never expand a state twice

How to implement:

Tree search + set of expanded states (“closed set”)

Graph Search

Idea: never expand a state twice

How to implement:

Tree search + set of expanded states (“closed set”)

Expand the search tree node-by-node, but...

Graph Search

Idea: never expand a state twice

How to implement:

Tree search + set of expanded states (“closed set”)
Expand the search tree node-by-node, but...
Before expanding a node,

Graph Search

Idea: never expand a state twice

How to implement:

- Tree search + set of expanded states (“closed set”)
- Expand the search tree node-by-node, but...
- Before expanding a node,
  - check if state was never been expanded before

Graph Search

Idea: never expand a state twice

How to implement:

Tree search + set of expanded states (“closed set”)
Expand the search tree node-by-node, but...
Before expanding a node,
check if state was never been expanded before
If yes skip it, else add to closed set and expand.

Graph Search

Idea: never expand a state twice

How to implement:

Tree search + set of expanded states ("closed set")
Expand the search tree node-by-node, but...
Before expanding a node,
check if state was never been expanded before
If yes skip it, else add to closed set and expand.

Important: store the closed set as a set, not a list

Graph Search

Idea: never expand a state twice

How to implement:

Tree search + set of expanded states ("closed set")
Expand the search tree node-by-node, but...
Before expanding a node,
check if state was never been expanded before
If yes skip it, else add to closed set and expand.

Important: store the closed set as a set, not a list

Can graph search wreck completeness?

Graph Search

Idea: never expand a state twice

How to implement:

Tree search + set of expanded states ("closed set")
Expand the search tree node-by-node, but...
Before expanding a node,
check if state was never been expanded before
If yes skip it, else add to closed set and expand.

Important: store the closed set as a set, not a list

Can graph search wreck completeness? Why/why not?
