# CS 188: Artificial Intelligence

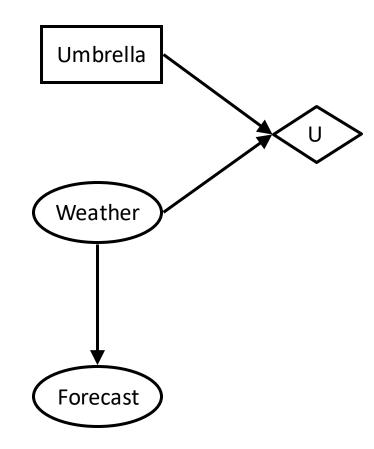

Decision Networks and Value of Perfect Information (VPI)

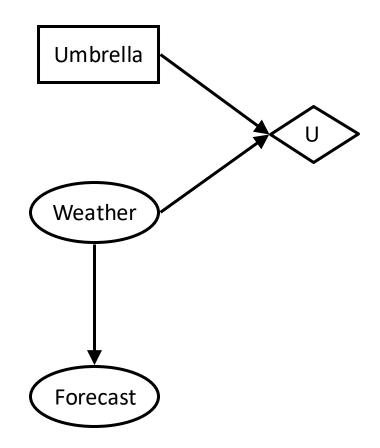

- MEU: choose the action which maximizes the expected utility given the evidence
- Can directly operationalize this with decision networks
  - Bayes nets with nodes for utility and actions
  - Lets us calculate the expected utility for each action
- New node types:
  - Chance nodes (just like BNs)
  - Actions (rectangles, cannot have parents, act as observed evidence)
  - Utility node (diamond, depends on action and chance nodes)

#### Action selection

- Instantiate all evidence
- Set action node(s) each possible way
- Calculate posterior for all parents of utility node, given the evidence
- Calculate expected utility for each action
- Choose maximizing action

Umbrella = leave

$$EU(leave) = \sum_{w} P(w)U(leave, w)$$
$$= 0.7 \cdot 100 + 0.3 \cdot 0 = 70$$

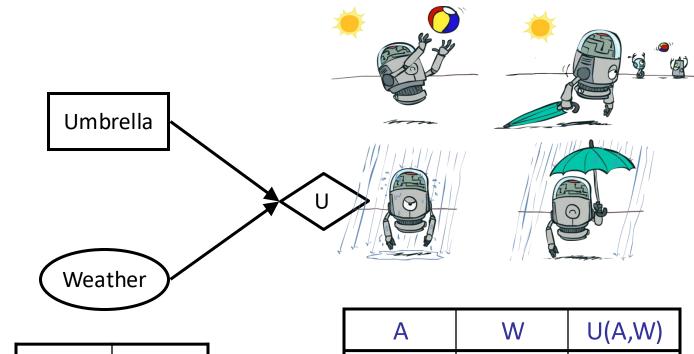

Umbrella = take

$$EU(take) = \sum_{w} P(w)U(take, w)$$

$$= 0.7 \cdot 20 + 0.3 \cdot 70 = 35$$

Optimal decision = leave

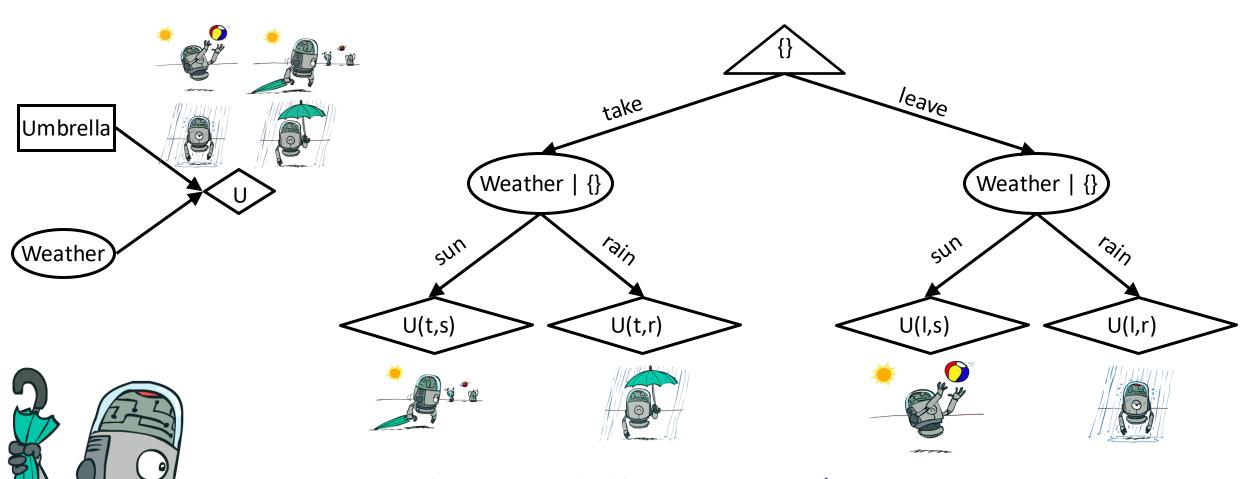

$$MEU(\emptyset) = \max_{a} EU(a) = 70$$

V	P(W)	
sun	0.7	
rain	0.3	

Α	W	U(A,W)
leave	sun	100
leave	rain	0
take	sun	20
take	rain	70

### Decisions as Outcome Trees

- Almost exactly like expectimax / MDPs
- What's changed?

## **Example: Decision Networks**

Umbrella = leave

$$EU(\text{leave}|\text{bad}) = \sum_{w} P(w|\text{bad})U(\text{leave}, w)$$

$$= 0.34 \cdot 100 + 0.66 \cdot 0 = 34$$

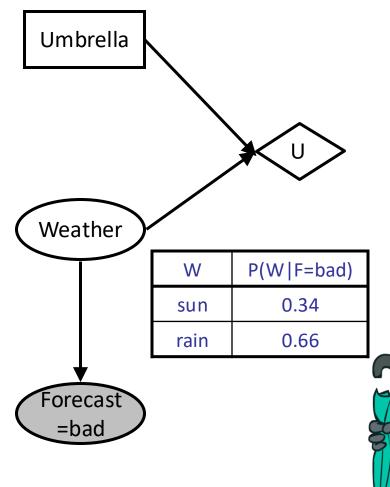

Umbrella = take

$$EU(take|bad) = \sum_{w} P(w|bad)U(take, w)$$

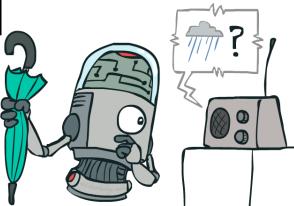

$$= 0.34 \cdot 20 + 0.66 \cdot 70 = 53$$

Optimal decision = take

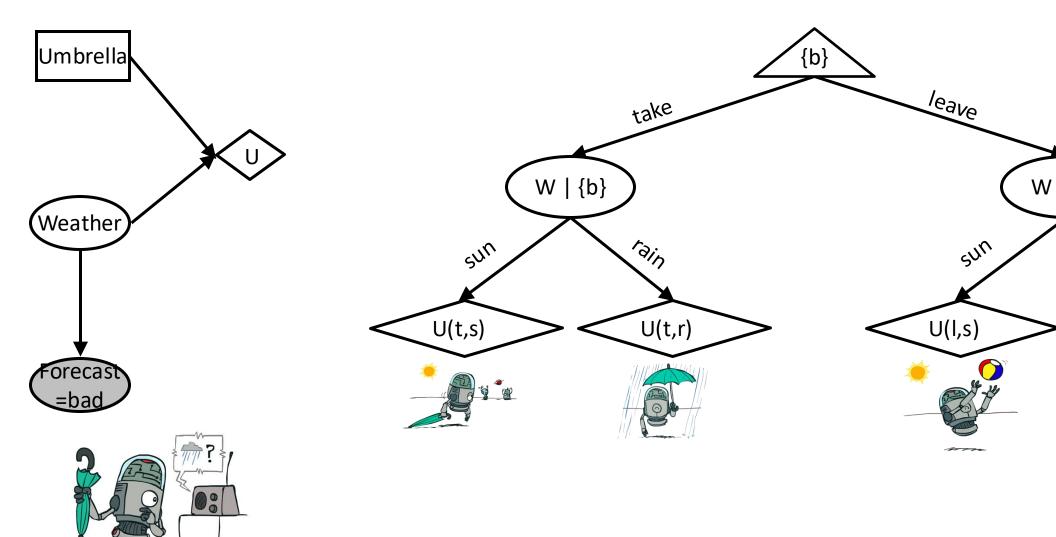

$$MEU(F = bad) = \max_{a} EU(a|bad) = 53$$

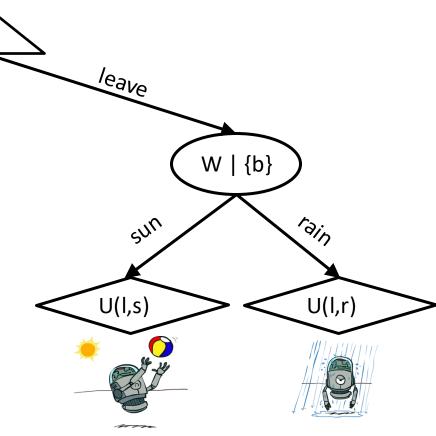

Α	W	U(A,W)		
leave	sun	100		
leave	rain	0		
take	sun	20		
take	rain	70		

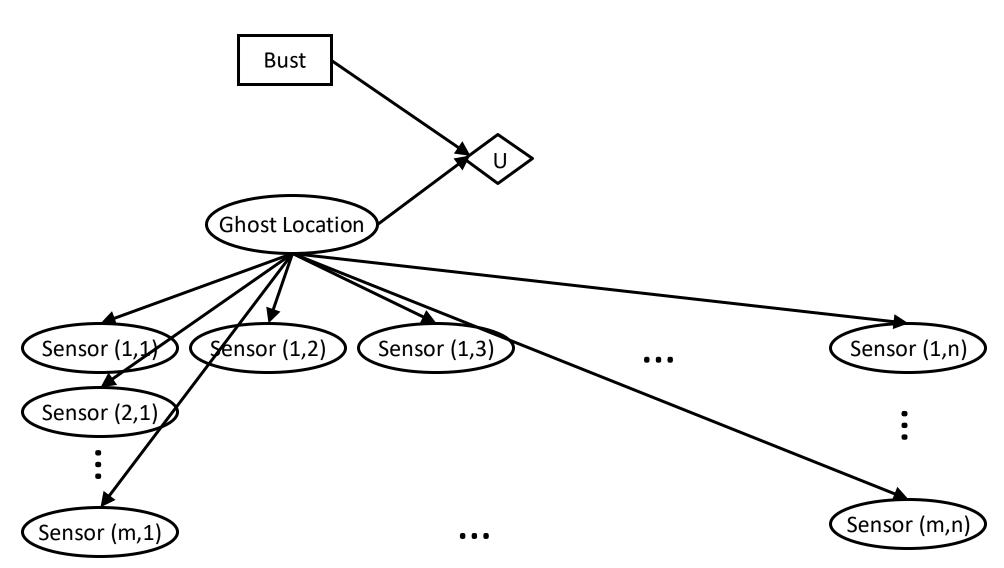

## **Decisions as Outcome Trees**

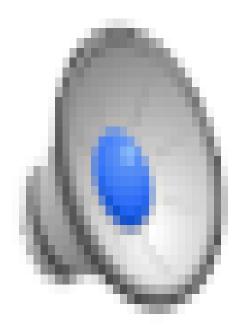

### **Ghostbusters Decision Network**

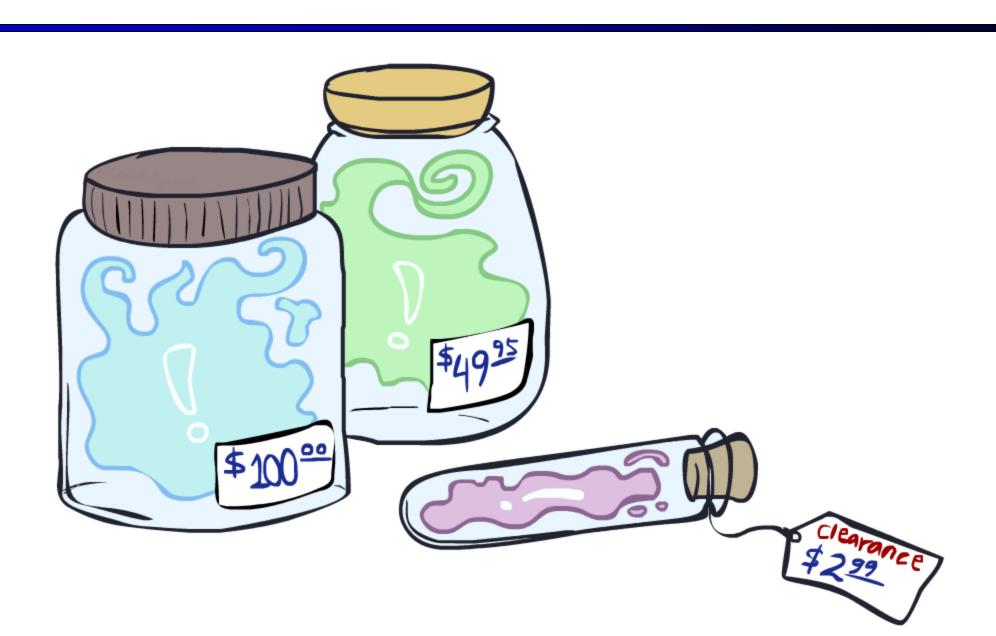

Demo: Ghostbusters with probability

# Video of Demo Ghostbusters with Probability

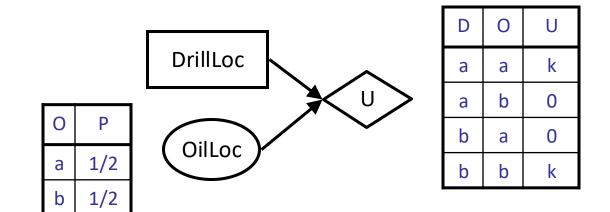

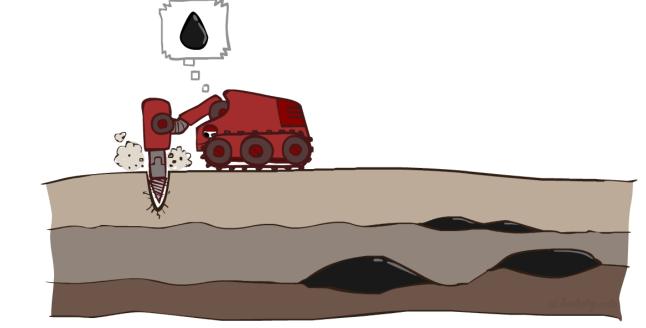

## Value of Information

### Value of Information

- Idea: compute value of acquiring evidence
  - Can be done directly from decision network
- Example: buying oil drilling rights
  - Two blocks A and B, exactly one has oil, worth k
  - You can drill in one location
  - Prior probabilities 0.5 each, & mutually exclusive
  - Drilling in either A or B has EU = k/2, MEU = k/2
- Question: what's the value of information of O?
  - Value of knowing which of A or B has oil
  - Value is expected gain in MEU from new info
  - Survey may say "oil in a" or "oil in b", prob 0.5 each
  - If we know OilLoc, MEU is k (either way)
  - Gain in MEU from knowing OilLoc?
  - VPI(OilLoc) = k/2
  - Fair price of information: k/2

## VPI Example: Weather

MEU with no evidence

$$MEU(\emptyset) = \max_{a} EU(a) = 70$$

MEU if forecast is bad

$$MEU(F = bad) = \max_{a} EU(a|bad) = 53$$

MEU if forecast is good

$$MEU(F = good) = \max_{a} EU(a|good) = 95$$

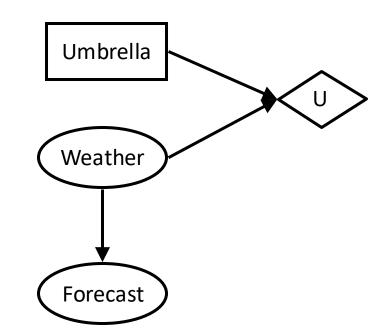

Forecast distribution

F	P(F)	
good	0.59	
		V

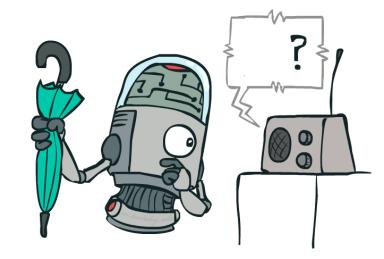

$$0.59 \cdot (95) + 0.41 \cdot (53) - 70$$
$$77.8 - 70 = 7.8$$

$$VPI(E'|e) = \left(\sum_{e'} P(e'|e)MEU(e,e')\right) - MEU(e)$$

Α	W	U
leave	sun	100
leave	rain	0
take	sun	20
take	rain	70

## Value of Information

Assume we have evidence E=e. Value if we act now:

$$MEU(e) = \max_{a} \sum_{s} P(s|e) U(s,a)$$

Assume we see that E' = e'. Value if we act then:

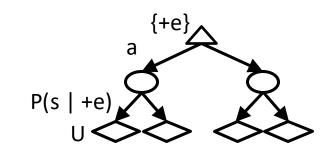

$$MEU(e, e') = \max_{a} \sum_{s} P(s|e, e') U(s, a)$$

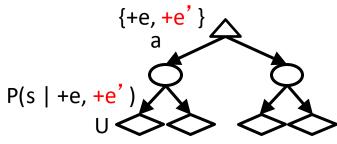

- BUT E' is a random variable whose value is unknown, so we don't know what e' will be
- Expected value if E' is revealed and then we act:

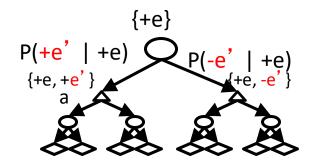

$$MEU(e, E') = \sum_{e'} P(e'|e)MEU(e, e')$$

Value of information: how much MEU goes up by revealing E' first then acting, over acting now:

$$VPI(E'|e) = MEU(e, E') - MEU(e)$$

## **VPI Properties**

Nonnegative

$$\forall E', e : \mathsf{VPI}(E'|e) \geq 0$$

Nonadditive

(think of observing E<sub>j</sub> twice)

$$VPI(E_j, E_k|e) \neq VPI(E_j|e) + VPI(E_k|e)$$

Order-independent

$$VPI(E_j, E_k|e) = VPI(E_j|e) + VPI(E_k|e, E_j)$$
$$= VPI(E_k|e) + VPI(E_j|e, E_k)$$

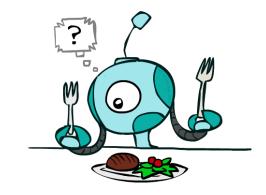

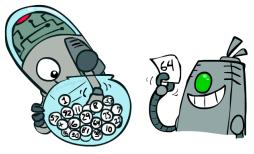

## **Quick VPI Questions**

- The soup of the day is either clam chowder or split pea, but you wouldn't order either one. What's the value of knowing which it is?
- There are two kinds of plastic forks at a picnic. One kind is slightly sturdier. What's the value of knowing which?
- You're playing the lottery. The prize will be \$0 or \$100. You can play any number between 1 and 100 (chance of winning is 1%). What is the value of knowing the winning number?

# Value of Imperfect Information?

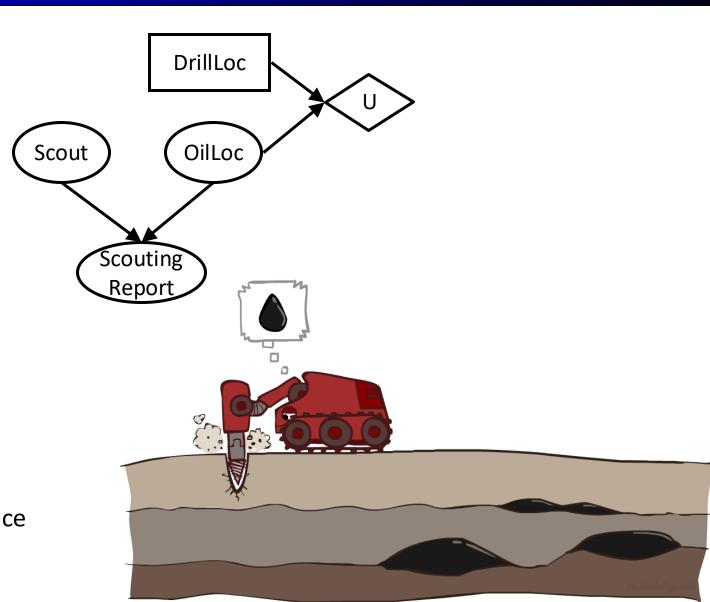

- No such thing (as we formulate it)
- Information corresponds to the observation of a node in the decision network
- If data is "noisy" that just means we don't observe the original variable, but another variable which is a noisy version of the original one

## **VPI** Question

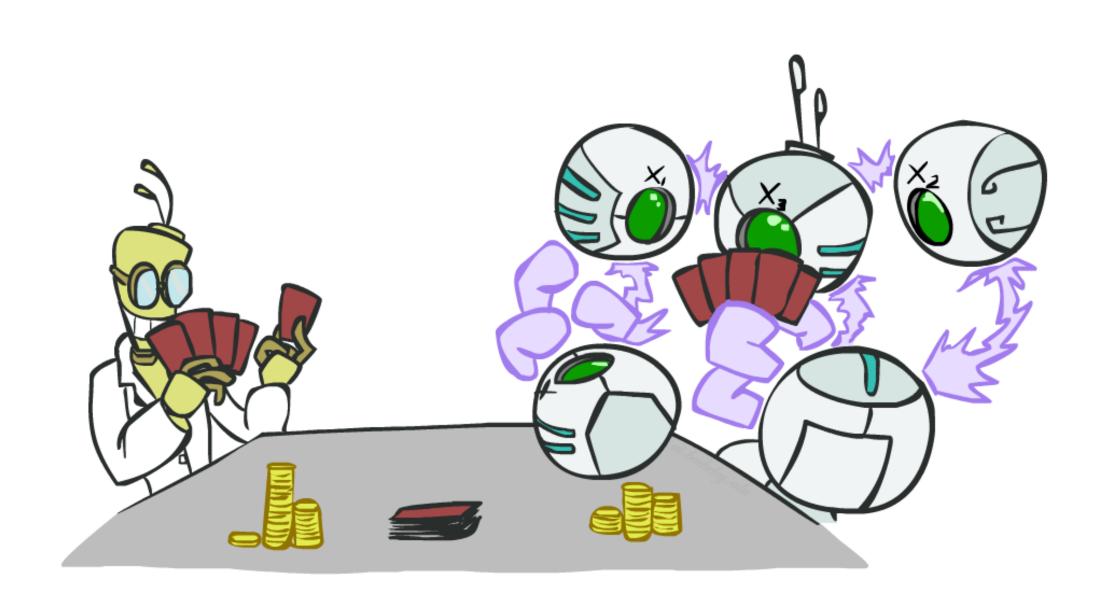

- VPI(OilLoc) ?
- VPI(ScoutingReport) ?
- VPI(Scout) ?
- VPI(Scout | ScoutingReport) ?

Generally:

If Parents(U)  $\parallel$  Z | CurrentEvidence Then VPI( Z | CurrentEvidence) = 0

# **POMDPs**

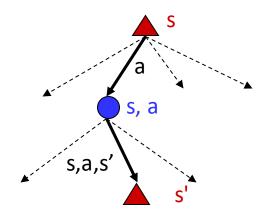

### **POMDPs**

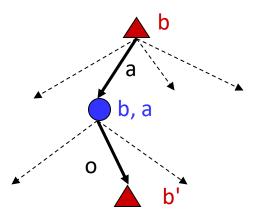

#### MDPs have:

- States S
- Actions A
- Transition function P(s'|s,a) (or T(s,a,s'))
- Rewards R(s,a,s')

#### POMDPs add:

- Observations O
- Observation function P(o|s) (or O(s,o))
- POMDPs are MDPs over belief states b (distributions over S)

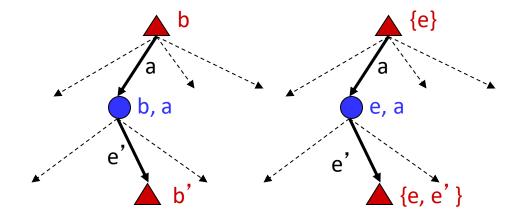

We'll be able to say more in a few lectures

## Example: Ghostbusters

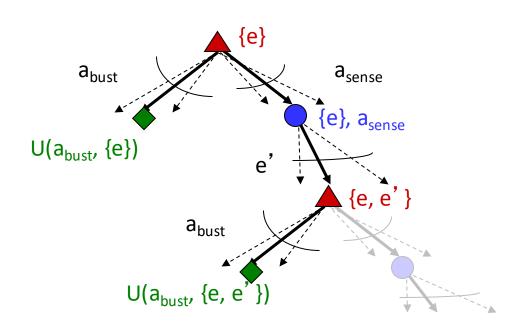

#### In (static) Ghostbusters:

- Belief state determined by evidence to date {e}
- Tree really over evidence sets
- Probabilistic reasoning needed to predict new evidence given past evidence

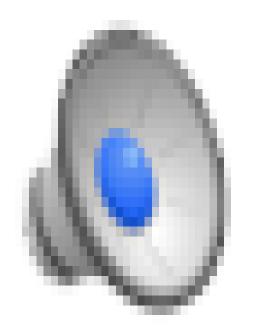

#### Solving POMDPs

- One way: use truncated expectimax to compute approximate value of actions
- What if you only considered busting or one sense followed by a bust?
- You get a VPI-based agent!

# Video of Demo Ghostbusters with VPI

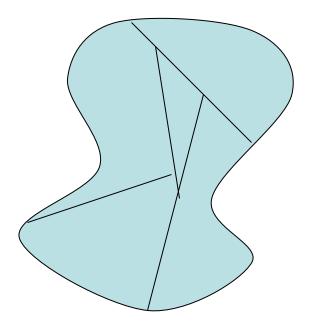

## More Generally\*

- General solutions map belief functions to actions
  - Can divide regions of belief space (set of belief functions) into policy regions (gets complex quickly)
  - Can build approximate policies using discretization methods
  - Can factor belief functions in various ways

Overall, POMDPs are very (actually PSPACE-) hard

 Most real problems are POMDPs, and we can rarely solve then in their full generality

# Next Time: Dynamic Models (HMMs)
