Q1. Bayes Nets: Variable Elimination

	P(A)	P(B A)	+b	-b
+a	0.25	+ <i>a</i>	0.5	0.5
<i>−a</i>	0.75	<i>−a</i>	0.25	0.75

P(D B)	+d	-d
+b	0.6	0.4
-b	0.8	0.2

P(C A)	+c	-c
+a	0.2	0.8
-a	0.6	0.4

P(E B)	+ <i>e</i>	-е
+b	0.25	0.75
-b	0.1	0.9

(a) Using the Bayes' Net and conditional probability tables above, calculate the following quantities:

(i)
$$P(+b|+a) =$$

(ii)
$$P(+a, +b) =$$

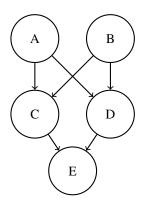

(iii)
$$P(+a|+b) =$$

- (b) Now we are going to consider variable elimination in the Bayes' Net above.
 - (i) Assume we have the evidence +c and wish to calculate $P(E \mid +c)$. What factors do we have initially?
 - (ii) If we eliminate variable B, we create a new factor. What probability does that factor correspond to?
 - (iii) What is the equation to calculate the factor we create when eliminating variable B?
 - (iv) After eliminating variable B, what are the new set of factors? As in (ii), write the probabilities that the factors represent. For each factor, also provide its size.

- (v) Now assume we have the evidence -c and are trying to calculate P(A|-c). What is the most efficient elimination ordering? If more than one ordering is most efficient, provide any one of them.
- (vi) Once we have run variable elimination and have f(A, -c) how do we calculate $P(+a \mid -c)$?

Q2. Bayes Nets and Joint Distributions

(a) Write down the joint probability distribution associated with the following Bayes Net. Express the answer as a product of terms representing individual conditional probabilities tables associated with this Bayes Net:

(b) Draw the Bayes net associated with the following joint distribution: $P(A) \cdot P(B) \cdot P(C|A, B) \cdot P(D|C) \cdot P(E|B, C)$

(c) Do the following products of factors correspond to a valid joint distribution over the variables A, B, C, D? (Circle FALSE or TRUE.)

(i)	FALSE	TRUE	$P(A) \cdot P(B) \cdot P(C A) \cdot P(C B) \cdot P(D C)$

(ii) FALSE TRUE
$$P(A) \cdot P(B|A) \cdot P(C) \cdot P(D|B,C)$$

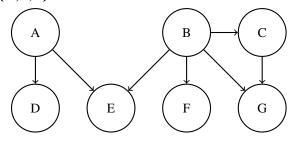

(iii) FALSE TRUE
$$P(A) \cdot P(B|A) \cdot P(C) \cdot P(C|A) \cdot P(D)$$

(iv) FALSE TRUE
$$P(A|B) \cdot P(B|C) \cdot P(C|D) \cdot P(D|A)$$

- (d) What factor can be multiplied with the following factors to form a valid joint distribution? (Write "none" if the given set of factors can't be turned into a joint by the inclusion of exactly one more factor.)
 - (i) $P(A) \cdot P(B|A) \cdot P(C|A) \cdot P(E|B,C,D)$
 - (ii) $P(D) \cdot P(B) \cdot P(C|D,B) \cdot P(E|C,D,A)$

(e) Answer the next questions based off of the Bayes Net below:

All variables have domains of {-1, 0, 1}

- (i) Before eliminating any variables or including any evidence, how many entries does the factor at G have?
- (ii) Now we observe e = 1 and want to query P(D|e = 1), and you get to pick the first variable to be eliminated.
 - Which choice would create the **largest** factor f_1 ?

• Which choice would create the **smallest** factor f_1 ?

Q3. Probability and Bayes Nets

(a) A, B, and C are random variables with binary domains. How many entries are in the following probability tables and what is the sum of the values in each table? Write a "?" in the box if there is not enough information given.

Table	Size	Sum
P(A, B C)		
P(A +b,+c)		
P(+a B)		

(b) Circle true if the following probability equalities are valid and circle false if they are invalid (leave it blank if you don't wish to risk a guess). Each True/False question is worth 1 points. Leaving a question blank is worth 0 points. **Answering incorrectly is worth −1 points.**

No independence assumptions are made.

- (i) [true or false] P(A, B) = P(A|B)P(A)
- (ii) [true or false] P(A|B)P(C|B) = P(A,C|B)
- (iii) [true or false] $P(B,C) = \sum_{a \in A} P(B,C|A)$
- (iv) [true or false] P(A, B, C, D) = P(C)P(D|C)P(A|C, D)P(B|A, C, D)
- (c) Space Complexity of Bayes Nets

Consider a joint distribution over N variables. Let k be the domain size for all of these variables, and let d be the maximum indegree of any node in a Bayes net that encodes this distribution.

- (i) What is the space complexity of storing the entire joint distribution? Give an answer of the form $O(\cdot)$.
- (ii) Draw an example of a Bayes net over four binary variables such that it takes less space to store the Bayes net than to store the joint distribution.

(iii) Draw an example of a Bayes net over four binary variables such that it takes more space to store the Bayes net than to store the joint distribution.
