CS 188: Artificial Intelligence

Bayes' Nets: Independence

Instructor: Oliver Grillmeyer — University of California, Berkeley

Announcements

- HW5 is due **Tuesday, July 15**, 11:59 PM PT
- HW6 is due Thursday, July 17, 11:59 PM PT
- Project 3 is due Friday, July 18, 11:59 PM PT
- Midterm is Wednesday July 23, 7-9 PM PT
- Look at Exam info under Policies link on CS 188 website

Probability Recap

Conditional probability

$$P(x|y) = \frac{P(x,y)}{P(y)}$$

Product rule

$$P(x,y) = P(x|y)P(y)$$

Chain rule

$$P(X_1, X_2, \dots X_n) = P(X_1)P(X_2|X_1)P(X_3|X_1, X_2)\dots$$
$$= \prod_{i=1}^n P(X_i|X_1, \dots, X_{i-1})$$

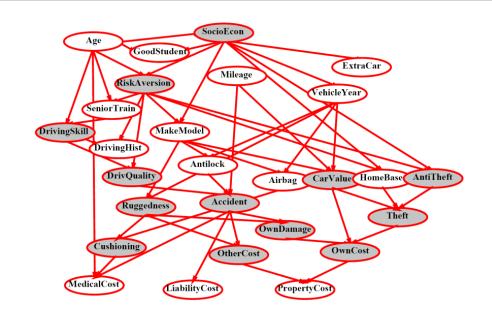

X, Y independent if and only if: $\forall x, y : P(x, y) = P(x)P(y)$

X and Y are conditionally independent given Z if and only if:

$$\forall x, y, z : P(x, y|z) = P(x|z)P(y|z)$$

Bayes' Nets

 A Bayes' net is an efficient encoding of a probabilistic model of a domain

- Questions we can ask:
 - Inference: given a fixed BN, what is P(X | e)?
 - Representation: given a BN graph, what kinds of distributions can it encode?
 - Modeling: what BN is most appropriate for a given domain?

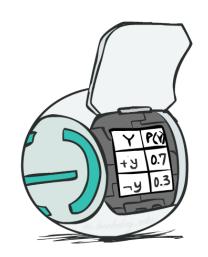

Bayes' Net Semantics

- A directed, acyclic graph, one node per random variable
- A conditional probability table (CPT) for each node
 - A collection of distributions over X, one for each combination of parents' values $P(X|a_1\dots a_n)$

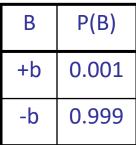

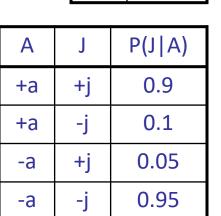

- Bayes' nets implicitly encode joint distributions
 - As a product of local conditional distributions
 - To see what probability a BN gives to a full assignment, multiply all the relevant conditionals together:

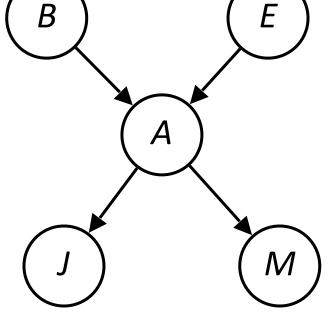

$$P(x_1, x_2, \dots x_n) = \prod_{i=1}^n P(x_i | parents(X_i))$$

Example: Alarm Network

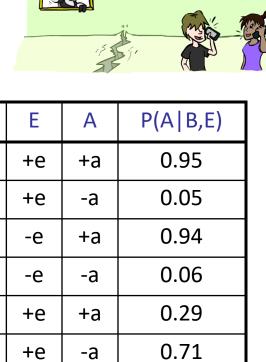

ш	P(E)
+e	0.002
φ	0.998

Α	M	P(M A)
+a	+m	0.7
+a	-m	0.3
-a	+m	0.01
-a	-m	0.99

0.001

0.999

+b

-a

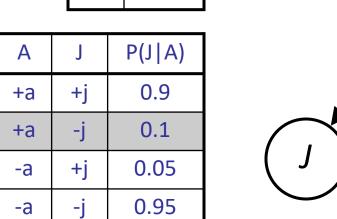

+a

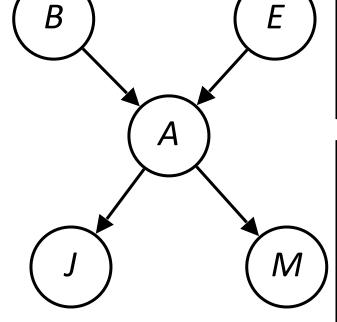

-a

P	+b.	-e.	+a.	-i.	+m	=
— /	$\langle \cdot \mid \cdot \cup \cdot \rangle$	\sim	-1 ω	J	1110	

Example: Alarm Network

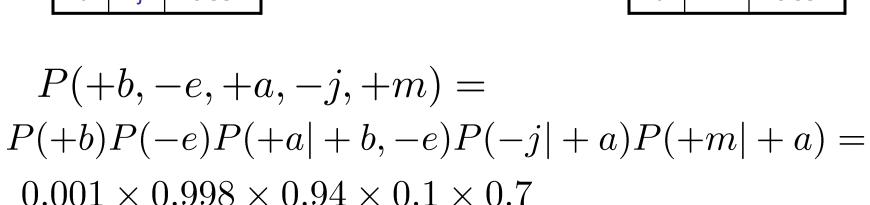

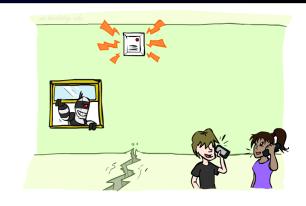

Е	P(E)
+e	0.002
-е	0.998

Α	M	P(M A)
+a	+m	0.7
+a	-m	0.3
-a	+m	0.01
-a	-m	0.99

В	Е	Α	P(A B,E)
+b	+e	+a	0.95
+b	+e	-a	0.05
+b	-e	+a	0.94
+b	-e	-a	0.06
-b	+e	+a	0.29
-b	+e	-a	0.71
-b	-e	+a	0.001
-b	-e	-a	0.999

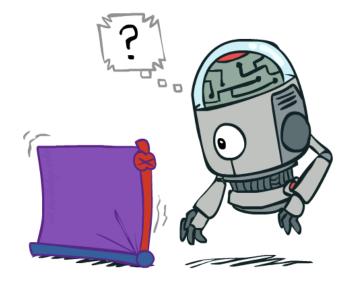

Size of a Bayes' Net

How big is a joint distribution over N Boolean variables?

2N

How big is an N-node net if nodes have up to k parents?

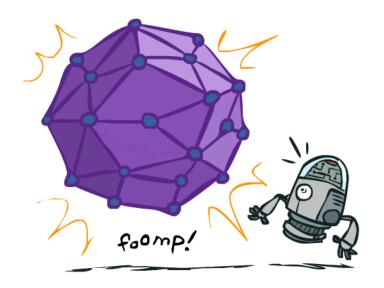

$$O(N * 2^{k+1})$$

Both give you the power to calculate

$$P(X_1, X_2, \dots X_n)$$

- BNs: Huge space savings!
- Also easier to elicit local CPTs
- Also faster to answer queries (coming)

Bayes' Nets

- Conditional Independences
- Probabilistic Inference
- Learning Bayes' Nets from Data

Conditional Independence

X and Y are independent if

$$\forall x, y \ P(x, y) = P(x)P(y) --- \rightarrow X \perp \!\!\! \perp Y$$

X and Y are conditionally independent given Z

$$\forall x, y, z \ P(x, y|z) = P(x|z)P(y|z) --- \rightarrow X \perp \!\!\!\perp Y|Z$$

(Conditional) independence is a property of a distribution

Example: $Alarm \bot Fire | Smoke |$

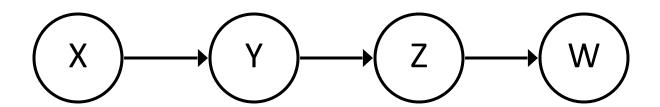

Bayes Nets: Assumptions

Assumptions we are required to make to define the Bayes net when given the graph:

$$P(x_i|x_1\cdots x_{i-1}) = P(x_i|parents(X_i))$$

- Beyond above "chain rule → Bayes net" conditional independence assumptions
 - Often additional conditional independences
 - They can be read off the graph
- Important for modeling: understand assumptions made when choosing a Bayes net graph

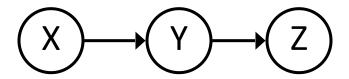

Conditional independence assumptions directly from simplifications in chain rule:

Additional implied conditional independence assumptions?

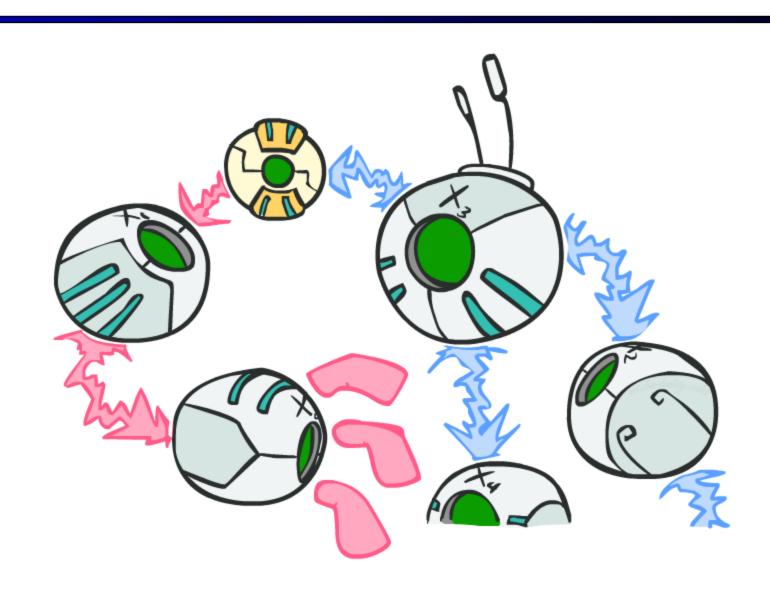

Independence in a BN

- Important question about a BN:
 - Are two nodes independent given certain evidence?
 - If yes, can prove using algebra (tedious in general)
 - If no, can prove with a counter example
 - Example:

- Question: are X and Z necessarily independent?
 - Answer: no. Example: low pressure causes rain, which causes traffic.
 - X can influence Z, Z can influence X (via Y)
 - Addendum: they could be independent: how?

D-separation: Outline

D-separation: Outline

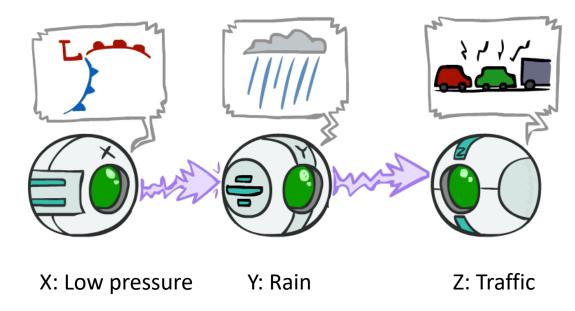

Study independence properties for triples

Analyze complex cases in terms of member triples

 D-separation: a condition / algorithm for answering such queries

Causal Chains

■ This configuration is a "causal chain"

$$P(x, y, z) = P(x)P(y|x)P(z|y)$$

Guaranteed X independent of Z? No!

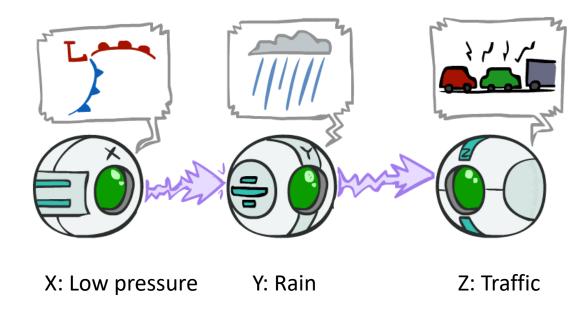

- One example set of CPTs for which X is not independent of Z is sufficient to show this independence is not guaranteed.
- Example:
 - Low pressure causes rain causes traffic, high pressure causes no rain causes no traffic
 - In numbers:

$$P(+y | +x) = 1, P(-y | -x) = 1,$$

 $P(+z | +y) = 1, P(-z | -y) = 1$

Causal Chains

■ This configuration is a "causal chain"

$$P(x, y, z) = P(x)P(y|x)P(z|y)$$

Guaranteed X independent of Z given Y?

$$P(z|x,y) = \frac{P(x,y,z)}{P(x,y)}$$

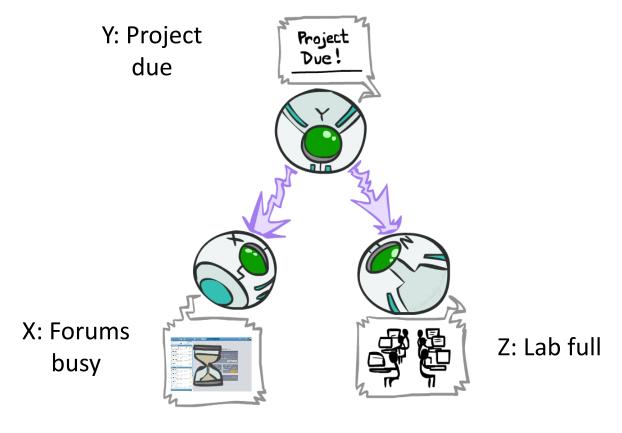

$$= \frac{P(x)P(y|x)P(z|y)}{P(x)P(y|x)}$$

$$= P(z|y)$$
Yes!

Evidence along the chain "blocks" the influence

Common Cause

■ This configuration is a "common cause"

P(x, y, z) = P(y)P(x|y)P(z|y)

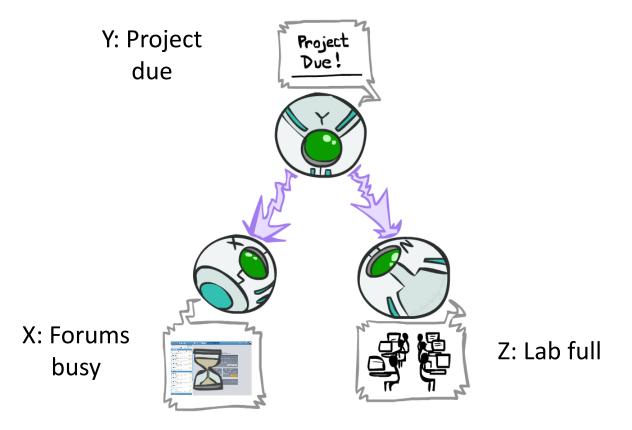

- Guaranteed X independent of Z? No!
 - One example set of CPTs for which X is not independent of Z is sufficient to show this independence is not guaranteed.
 - Example:
 - Project due causes both forums busy and lab full
 - In numbers:

$$P(+x | +y) = 1, P(-x | -y) = 1,$$

 $P(+z | +y) = 1, P(-z | -y) = 1$

Common Cause

This configuration is a "common cause"

$$P(x, y, z) = P(y)P(x|y)P(z|y)$$

Guaranteed X and Z independent given Y?

$$P(z|x,y) = \frac{P(x,y,z)}{P(x,y)}$$

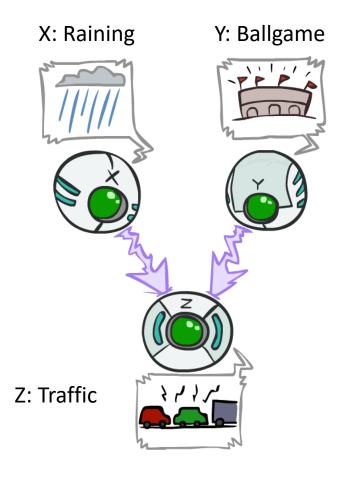

$$= \frac{P(y)P(x|y)P(z|y)}{P(y)P(x|y)}$$

$$= P(z|y)$$
Yes!

 Observing the cause blocks influence between effects.

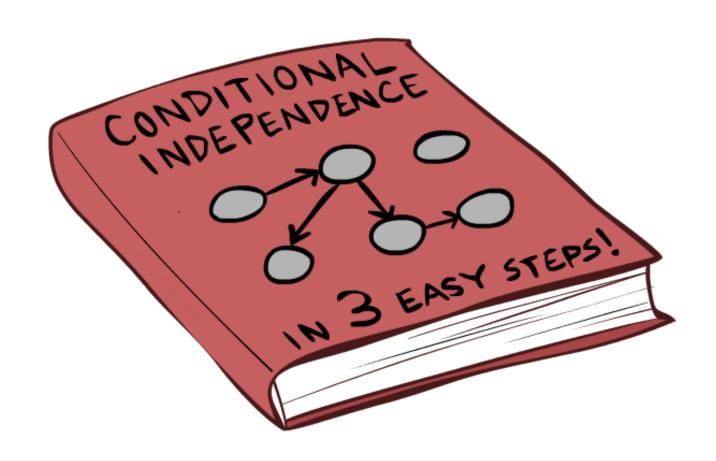

Common Effect

 Last configuration: two causes of one effect (v-structures)

- Are X and Y independent?
 - Yes: the ballgame and the rain cause traffic, but they are not correlated
 - Still need to prove they must be (try it!)
- Are X and Y independent given Z?
 - No: seeing traffic puts the rain and the ballgame in competition as explanation.
- This is backwards from the other cases
 - Observing an effect activates influence between possible causes.

The General Case

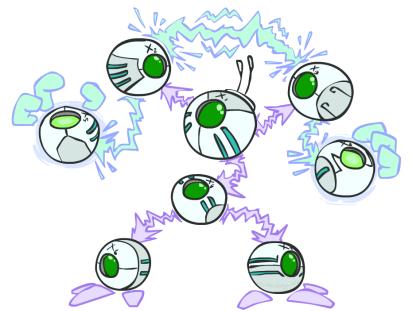

The General Case

General question: in a given BN, are two variables independent (given evidence)?

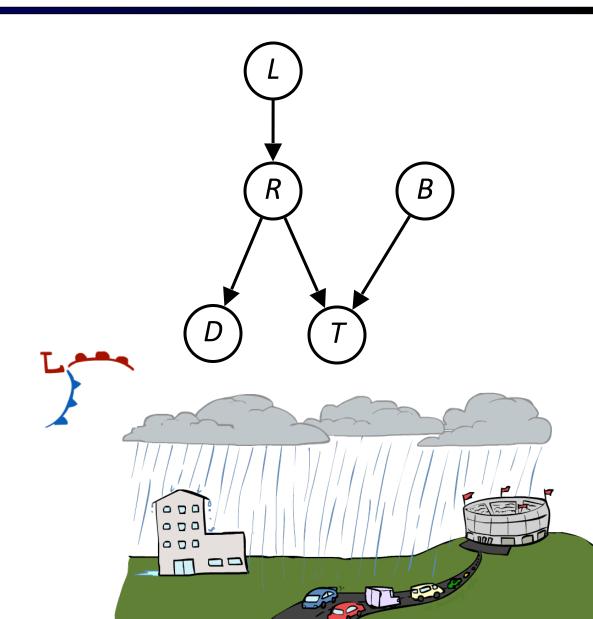

Solution: analyze the graph

Any complex example can be broken
 into repetitions of the three canonical cases

Reachability

- Recipe: shade evidence nodes, look for paths in the resulting graph
- Attempt 1: if two nodes are connected by an undirected path not blocked by a shaded node, they are conditionally independent
- Almost works, but not quite
 - Where does it break?
 - Answer: the v-structure at T doesn't count as a link in a path unless "active"

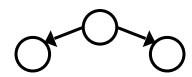

Active / Inactive Paths

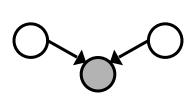

- Question: Are X and Y conditionally independent given evidence variables {Z}?
 - Yes, if X and Y "d-separated" by Z
 - Consider all (undirected) paths from X to Y
 - No active paths = independence!

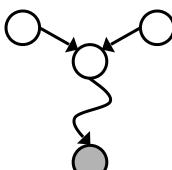

- A path is active if each triple is active:
 - Causal chain $A \rightarrow B \rightarrow C$ where B is unobserved (either direction)
 - Common cause $A \leftarrow B \rightarrow C$ where B is unobserved
 - Common effect (aka v-structure)
 A → B ← C where B or one of its descendants is observed
- All it takes to block a path is a single inactive segment

Active Triples

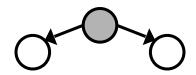

Inactive Triples

Recap of Triples

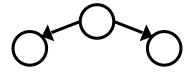

Active Triples

 \bigcirc

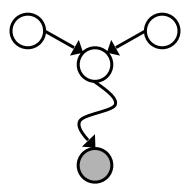

Common Cause:

Causal Chain:

Common Effect ("v-structure")

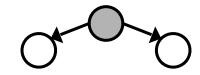

Inactive Triples

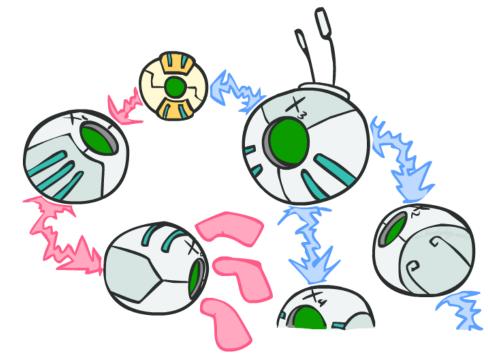

D-Separation

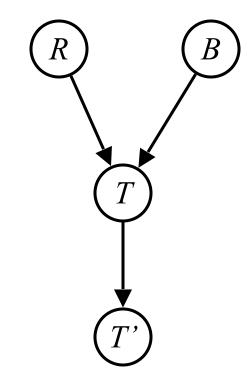

- Query: $X_i \perp \!\!\! \perp X_j | \{X_{k_1},...,X_{k_n}\}$
- lacktriangle Check all (undirected!) paths between X_i and X_j
 - If one or more active, then independence not guaranteed

$$X_i \not \perp X_j | \{X_{k_1}, ..., X_{k_n}\}$$

Otherwise (i.e. if all paths are inactive),
 then independence is guaranteed

$$X_i \perp \!\!\! \perp X_j | \{X_{k_1}, ..., X_{k_n}\}$$

$$L \! \perp \! \! \perp \! \! T' | T$$
 Yes

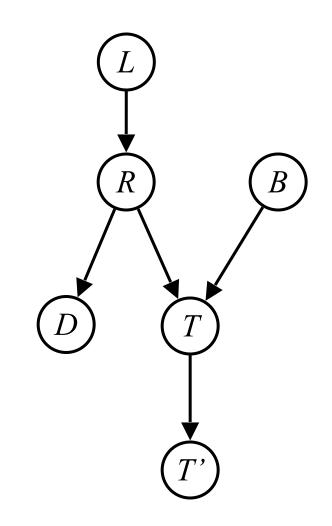

$$L \! \perp \! \! \! \perp \! \! B$$

$$L \! \perp \! \! \perp \! \! B | T$$

$$L \! \perp \! \! \perp \! \! B | T$$

 $L \! \perp \! \! \! \perp \! \! B | T'$

$$L \! \perp \! \! \perp \! \! B | T, R$$
 Yes

Variables:

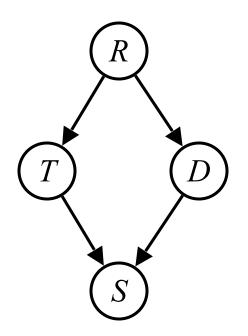

R: Raining

■ T: Traffic

■ D: Roof drips

■ S: I'm sad

• Questions:

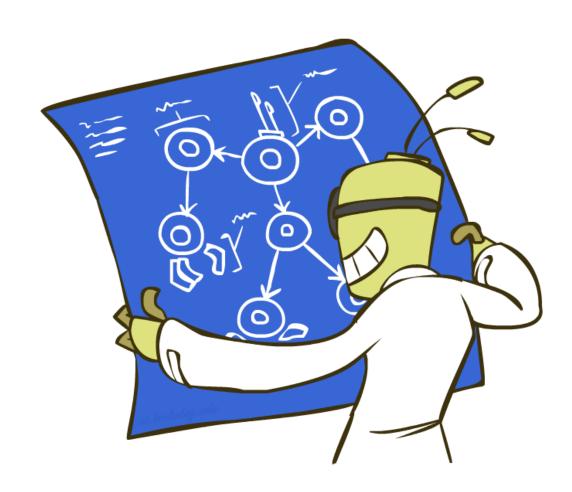

Structure Implications

 Given a Bayes net structure, can run dseparation algorithm to build a complete list of conditional independences that are necessarily true of the form

$$X_i \perp \!\!\!\perp X_j | \{X_{k_1}, ..., X_{k_n}\}$$

 This list determines the set of probability distributions that can be represented

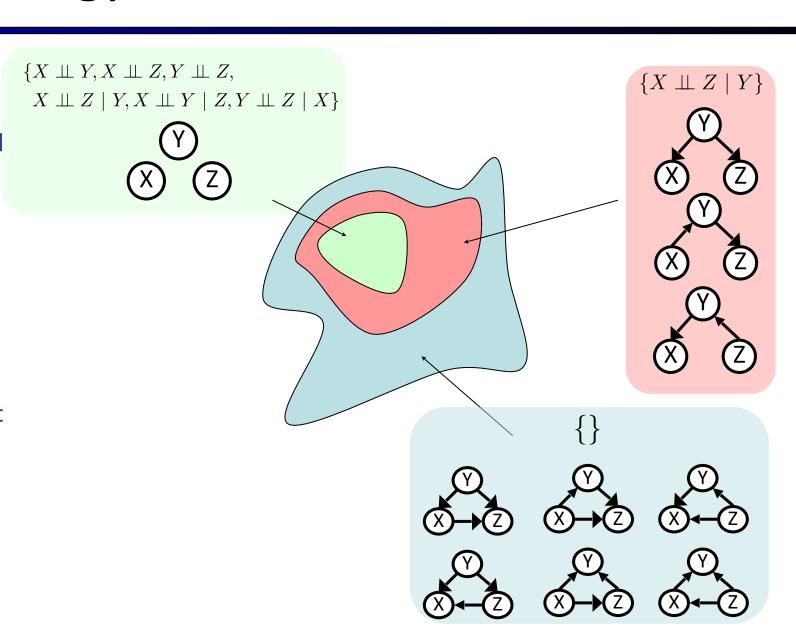

Computing All Independences

Topology Limits Distributions

- Given some graph topology
 G, only certain joint
 distributions can be encoded
- The graph structure guarantees certain (conditional) independences
- (There might be more independence)
- Adding arcs increases the set of distributions, but has several costs
- Full conditioning can encode any distribution

Bayes Nets Representation Summary

- Bayes nets compactly encode joint distributions
- Guaranteed independencies of distributions can be deduced from BN graph structure
- D-separation gives precise conditional independence guarantees from graph alone
- A Bayes' net's joint distribution may have further (conditional) independence that is not detectable until you inspect its specific distribution

Bayes' Nets

- Representation
- Conditional Independences
 - Probabilistic Inference
 - Enumeration (exact, exponential complexity)
 - Variable elimination (exact, worst-case exponential complexity, often better)
 - Probabilistic inference is NP-complete
 - Sampling (approximate)
 - Learning Bayes' Nets from Data
