

CNM 190
Advanced Digital Animation

Dan Garcia, EECS (co-instructor)
Brian A. Barsky, EECS (co-instructor)
Jeremy Huddleston, EECS (TA)

Pixar Production Pipeline

Story-driven process

- Pixar filmmaking process is story-driven
 - use traditional skills like storytelling, drawing, painting and sculpture
 - allows the work to be easily shared, keeps it informal and encourages experimentation
 - Technology serves the needs of the story
 - Story determines what to put in the film and technology responds

CNM190 : Advanced Digital Animation 3/16

World, Character, Story

- The story process is moved forward by designs for the world & characters of the film
 - The world has its own rules, that limit what the characters can do
 - Building unique worlds is at the heart of animation
 - The characters have things they want and need, that push the limits of the world
 - Characters should feel like they live beyond the frame of the film

CNM190 : Advanced Digital Animation 4/16

Design

- Everything is design
 - alternate cycles of planning and implementation
 - avoid 'waterfall design' where all design is complete before implementation begins
 - don't do any manufacturing
 - that happens at Technicolor after print is finished

CNM190 : Advanced Digital Animation 5/16

Timeline & Departments

- four year design process
 - Planning — all four years
 - Story, Art, Editorial
 - Implementation — the last two years
 - Editorial
 - Modeling, Articulation, Shading, Digital Paint
 - Layout, Set Dressing, Animation, Lighting
 - Rendering

CNM190 : Advanced Digital Animation 6/16

Story, Art & Editorial

- Three departments are the focus of design
 - Story creates storyboards
 - Drawings that are a comic strip version of the film's important moments
 - Art creates inspirational images, character and set designs, colorscripts and lighting pastels
 - Refined images that establish the look and feel of the film
 - Editorial creates story reels
 - A rough draft form of the film made using the storyboard drawings, scratch dialog and borrowed music
- The goal of the planning process is a solid story reel

CNM190 : Advanced Digital Animation

7/16

Objects & Shots

- The implementation of the film is split between making objects and using those objects to make shots
 - Everything in the film (every character, prop and location) must be created first
 - Nothing is free; if it is in the film, it must be imagined and built
 - Shots are created by populating each scene in the story with the correct objects
 - Only once the cast is on the set with their props can we begin the visual storytelling

CNM190 : Advanced Digital Animation

8/16

Objects

- The shape and shading are created separately for every object
 - Modeling and Articulation deals with shape and how the shape moves
 - These are primarily 3D skills
 - Shading and Painting works on surface
 - These are primarily 2D skills

CNM190 : Advanced Digital Animation

9/16

Modeling & Articulation

- Modeling & Articulation handles the shape of the objects, and how they can be moved
 - Modeling is like sculpture, inside the computer — it creates the static shape of the object
 - The model does not bend
 - Articulation or rigging provides the 'hinges/joints' in the model that allow it to be positioned
 - The rigged model can be posed (... and in the hands of an animator, can act)
 - Props and sets get less articulation than characters

CNM190 : Advanced Digital Animation

10/16

Shading & Painting

- Shading and painting deal with the surface color and texture of the object
 - A procedural shader is a computer program that represents how light interacts with a surface
 - Shaders can provide surface deformation as well as color — they can make a smooth model look bumpy
 - Digital painting allows textures or other paint marks to be applied directly to surfaces
 - Once a surface has been shaded, digital paint can be used to rough it up or add other naturalistic details

CNM190 : Advanced Digital Animation

11/16

Shots

- Objects are assembled into shots
 - Layout sets up the basic blocking for character and camera movement
 - Layout is informed by the storyboards and story reel
 - Set Dressing ensures each shot is well framed by the set and props
 - Dressing may also build the set used by Layout
 - Animation moves each object
 - Animation provides the acting in 1/24ths of a second
 - Lighting illuminates the shot to focus the action and to help create the mood
 - Lighting is directed by images created by Art

CNM190 : Advanced Digital Animation

12/16

Animation

- Animate means “to bring to life”
 - Animation uses the hinges/joints in the object’s rig — “avars” or articulated variables — to change its location & position over time
 - Animators are actors who can break down a performance into poses
 - Each pose attempts to capture the essence of the character’s thoughts and feelings

CNM190 : Advanced Digital Animation

13/16

Rendering

- Rendering is the final step in the implementation pipeline
 - Rendering is like taking a digital picture of the world inside the computer
 - The renderer produces a 2D image of the 3D scene in the computer
 - A film comprises 120,000 or more rendered 2D images, each onscreen for 1/24th of a second
