

## Advanced Computer Graphics (Fall 2009)

CS 294, Rendering Lecture 3: Global Illumination  
<http://inst.eecs.berkeley.edu/~cs294-13/fa09>

Some images courtesy Henrik Jensen  
Some slide ideas courtesy Pat Hanrahan

## Illumination Models

So far considered mainly local illumination

- Light directly from light sources to surface
- No shadows (cast shadows are a global effect)

*Global Illumination: multiple bounces (indirect light)*

- Hard and soft shadows
- Reflections/refractions (already seen in ray tracing)
- Diffuse and glossy interreflections (radiosity, caustics)

Some images courtesy Henrik Wann Jensen

## Diffuse Interreflection

Diffuse interreflection, color bleeding [Cornell Box]

## Radiosity

## Caustics

Caustics: Focusing through specular surface

- Major research effort in 80s, 90s till today

## Overview of lecture

- *Theory* for all global illumination methods (ray tracing, path tracing, radiosity)
- We derive *Rendering Equation* [Kajiya 86]
  - Major theoretical development in field
  - Unifying framework for all global illumination
- Discuss existing approaches as special cases

Fairly theoretical lecture (but important). Not well covered in textbooks (though see Eric Veach's thesis). Closest are 2.6.2 in Cohen and Wallace handout (but uses slightly different notation, argument [swaps  $x$ ,  $x'$  among other things])

## Outline

- *Reflectance Equation (review)*
- *Global Illumination*
- *Rendering Equation*
- As a general Integral Equation and Operator
- Approximations (Ray Tracing, Radiosity)
- Surface Parameterization (Standard Form)

## Reflectance Equation (review)

$$L_r(x, \omega_r) = L_e(x, \omega_r) + L_i(x, \omega_i) f(x, \omega_i, \omega_r) (\omega_i \cdot n)$$

Reflected Light (Output Image)	Emission	Incident Light (from light source)	BRDF	Cosine of Incident angle
-----------------------------------	----------	--	------	-----------------------------

## Reflectance Equation (review)

Sum over all light sources

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \sum L_i(x, \omega_i) f(x, \omega_i, \omega_r) (\omega_i \cdot n)$$

Reflected Light (Output Image)	Emission	Incident Light (from light source)	BRDF	Cosine of Incident angle
-----------------------------------	----------	--	------	-----------------------------

## Reflectance Equation (review)

Replace sum with integral

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_i(x, \omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Reflected Light (Output Image)	Emission	Incident Light (from light source)	BRDF	Cosine of Incident angle
-----------------------------------	----------	--	------	-----------------------------

## The Challenge

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_i(x, \omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

- Computing reflectance equation requires knowing the incoming radiance from surfaces
- But determining incoming radiance requires knowing the reflected radiance from surfaces

## Global Illumination

$$\omega_i \sim x' - x$$

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Reflected Light (Output Image)	Emission	Reflected Light (from surface)	BRDF	Cosine of Incident angle
-----------------------------------	----------	--------------------------------------	------	-----------------------------

### Rendering Equation

Surfaces (interreflection)

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Reflected Light (Output Image)	Emission	Reflected Light	BRDF	Cosine of Incident angle
UNKNOWN	KNOWN	UNKNOWN	KNOWN	KNOWN

### Rendering Equation (Kajiya 86)

Figure 6. A sample image. All objects are neutral grey. Color on the objects is due to caustics from the green glass balls and color bleeding from the base objects.

### Outline

- Reflectance Equation (review)
- Global Illumination
- Rendering Equation
- *As a general Integral Equation and Operator*
- *Approximations (Ray Tracing, Radiosity)*
- Surface Parameterization (Standard Form)

### Rendering Equation as Integral Equation

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Reflected Light (Output Image)	Emission	Reflected Light	BRDF	Cosine of Incident angle
UNKNOWN	KNOWN	UNKNOWN	KNOWN	KNOWN

Is a Fredholm Integral Equation of second kind [extensively studied numerically] with canonical form

$$l(u) = e(u) + \int l(v) K(u, v) dv$$

Kernel of equation

### Linear Operator Theory

- Linear operators act on functions like matrices act on vectors or discrete representations

$$h(u) = (M \circ f)(u)$$

M is a linear operator.  
f and h are functions of u

- Basic linearity relations hold a and b are scalars  
f and g are functions

$$M \circ (af + bg) = a(M \circ f) + b(M \circ g)$$

- Examples include integration and differentiation

$$(K \circ f)(u) = \int k(u, v) f(v) dv$$

$$(D \circ f)(u) = \frac{\partial f}{\partial u}(u)$$

### Linear Operator Equation

$$l(u) = e(u) + \int l(v) K(u, v) dv$$

Kernel of equation  
Light Transport Operator

$$L = E + KL$$

Can also be discretized to simple matrix equation [or system of simultaneous linear equations] (L, E are vectors, K is the light transport matrix)

## Solving the Rendering Equation

$$L = E + KL$$

$$IL - KL = E$$

$$(I - K)L = E$$

$$L = (I - K)^{-1}E$$

Binomial Theorem

$$L = (I + K + K^2 + K^3 + \dots)E$$

$$L = E + KE + K^2E + K^3E + \dots$$

Term n corresponds to n bounces of light

## Solving the Rendering Equation

- Too hard for analytic solution, numerical methods
- Approximations, that compute different terms, accuracies of the rendering equation
- Two basic approaches are ray tracing, radiosity. More formally, Monte Carlo and Finite Element
- Monte Carlo techniques sample light paths, form statistical estimate (example, path tracing)
- Finite Element methods discretize to matrix equation

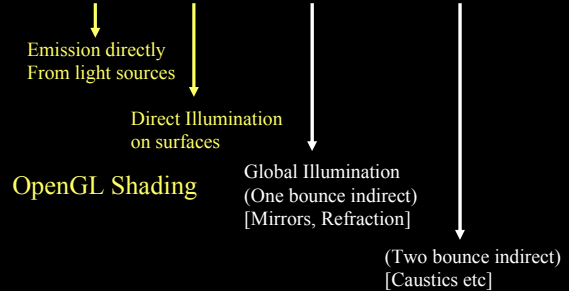

### Ray Tracing

$$L = E + KE + K^2E + K^3E + \dots$$

### Ray Tracing

$$L = E + KE + K^2E + K^3E + \dots$$

### Successive Approximation

CS348B Lecture 13

Pat Hanrahan, Spring 2009

### Outline

- Reflectance Equation (review)
- Global Illumination
- Rendering Equation
- As a general Integral Equation and Operator
- Approximations (Ray Tracing, Radiosity)
- *Surface Parameterization (Standard Form)*

### Rendering Equation

Surfaces (interreflection)

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Reflected Light (Output Image)	Emission	Reflected Light	BRDF	Cosine of Incident angle
UNKNOWN	KNOWN	UNKNOWN	KNOWN	KNOWN

### Change of Variables

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Integral over angles sometimes insufficient. Write integral in terms of surface radiance only (change of variables)

$$d\omega_i = \frac{dA' \cos \theta_o}{|x - x'|^2}$$

### Change of Variables

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Integral over angles sometimes insufficient. Write integral in terms of surface radiance only (change of variables)

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\text{all } x' \text{ visible to } x} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \frac{\cos \theta_i \cos \theta_o}{|x - x'|^2} dA'$$

$$d\omega_i = \frac{dA' \cos \theta_o}{|x - x'|^2}$$

$$G(x, x') = G(x', x) = \frac{\cos \theta_i \cos \theta_o}{|x - x'|^2}$$

### Rendering Equation: Standard Form

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\Omega} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \cos \theta_i d\omega_i$$

Integral over angles sometimes insufficient. Write integral in terms of surface radiance only (change of variables)

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\text{all } x' \text{ visible to } x} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) \frac{\cos \theta_i \cos \theta_o}{|x - x'|^2} dA'$$

Domain integral awkward. Introduce binary visibility fn V

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\text{all surfaces } x'} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) G(x, x') V(x, x') dA'$$

Same as equation 2.52 Cohen Wallace. It swaps primed and unprimed, omits angular args of BRDF, - sign.  
Same as equation above 19.3 in Shirley, except he has no emission, slightly diff. notation

$$d\omega_i = \frac{dA' \cos \theta_o}{|x - x'|^2}$$

$$G(x, x') = G(x', x) = \frac{\cos \theta_i \cos \theta_o}{|x - x'|^2}$$

### Radiosity Equation

$$L_r(x, \omega_r) = L_e(x, \omega_r) + \int_{\text{all surfaces } x'} L_r(x', -\omega_i) f(x, \omega_i, \omega_r) G(x, x') V(x, x') dA'$$

Drop angular dependence (diffuse Lambertian surfaces)

$$L_r(x) = L_e(x) + f(x) \int_{\text{all surfaces } x'} L_r(x') G(x, x') V(x, x') dA'$$

Change variables to radiosity (B) and albedo (\rho)

$$B(x) = E(x) + \rho(x) \int_{\text{all surfaces } x'} B(x') \frac{G(x, x') V(x, x')}{\pi} dA'$$

Expresses conservation of light energy at all points in space

Same as equation 2.54 in Cohen Wallace handout (read sec 2.6.3)  
Ignore factors of \pi which can be absorbed.

### Discretization and Form Factors

$$B(x) = E(x) + \rho(x) \int_{\text{all surfaces } x'} B(x') \frac{G(x, x') V(x, x')}{\pi} dA'$$

$$B_i = E_i + \rho_i \sum_j B_j F_{j \rightarrow i} \frac{A_j}{A_i}$$

F is the **form factor**. It is dimensionless and is the fraction of energy leaving the entirety of patch j (multiply by area of j to get total energy) that arrives anywhere in the entirety of patch i (divide by area of i to get energy per unit area or radiosity).

## Form Factors

$$A_i F_{i \rightarrow j} = A_j F_{j \rightarrow i} = \iint \frac{G(x, x') V(x, x')}{\pi} dA_i dA_j$$

$$G(x, x') = G(x', x) = \frac{\cos \theta_i \cos \theta_o}{|x - x'|^2}$$

## Matrix Equation

$$B_i = E_i + \rho_i \sum_j B_j F_{j \rightarrow i} \frac{A_j}{A_i}$$

$$A_i F_{i \rightarrow j} = A_j F_{j \rightarrow i} = \iint \frac{G(x, x') V(x, x')}{\pi} dA_i dA_j$$

$$B_i = E_i + \rho_i \sum_j B_j F_{i \rightarrow j}$$

$$B_i - \rho_i \sum_j B_j F_{i \rightarrow j} = E_i$$

$$\sum_j M_{ij} B_j = E_i \quad MB = E \quad M_{ij} = I_{ij} - \rho_i F_{i \rightarrow j}$$

## Summary

- **Theory** for all global illumination methods (ray tracing, path tracing, radiosity)
- We derive **Rendering Equation** [Kajiya 86]
  - Major theoretical development in field
  - Unifying framework for all global illumination
- Discuss existing approaches as special cases
- Next: Practical solution using Monte Carlo methods
