61A Lecture 5

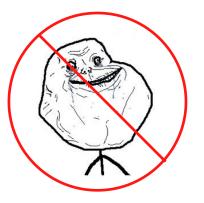

Wednesday, September 10

Announcements

- Take-home quiz released Wednesday 9/10 at 3pm, due Thursday 9/11 at 11:59pm
 - http://cs61a.org/hw/released/quiz1.html
 - ■3 points; graded for correctness
 - Submit in the same way that you submit homework assignments
 - If you receive 0/3, you will need to talk to the course staff or be dropped
 - •Open computer & course materials, but no external resources such as classmates
 - ■Practice quiz from Fall 2013: http://inst.eecs.berkeley.edu/~cs61a/fa13/hw/quiz1.html
- "Practical Programming Skills" DeCal starts Thursday 9/11, 6:30pm to 8pm in 306 Soda
 - http://42.cs61a.org, run by Sumukh Sridhara (TA)
- •Guerrilla Section 1 on Higher-order functions: Saturday 9/13, 12:30pm to 3pm in 306 Soda
- Homework 2 (which is small) due Monday 9/15 at 11:59pm.
- $^{\circ}$ Project 1 (which is BIG) due Wednesday 9/17 at 11:59pm.

Office Hours: You Should Go!

You are not alone!

http://cs61a.org/staff.html

Environments for Higher-Order Functions

Environments Enable Higher-Order Functions

Functions are first-class: Functions can be manipulated as values in our programming language.

Higher-order function: A function that takes a function as an argument value or returns a function as a return value

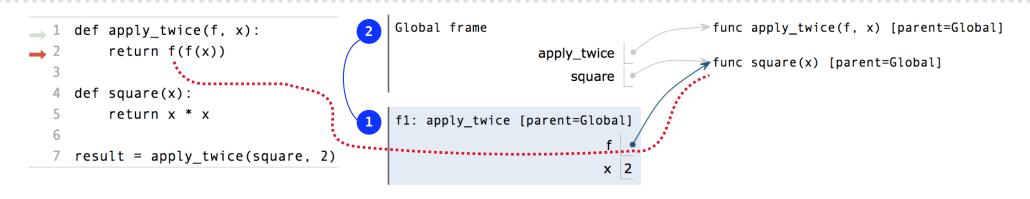

Higher-order functions:

- Express general methods of computation
- Remove repetition from programs
- Separate concerns among functions

Environment diagrams describe how higher-order functions work!

Names can be Bound to Functional Arguments

```
Global frame
                                                         func apply twice(f, x) [parent=Global]
def apply_twice(f, x):
    return f(f(x))
                                    apply_twice
                                                         func square(x) [parent=Global]
                                        square
                                                                 Applying a user-defined function:
def square(x):
                                                                 • Create a new frame
    return x * x
                                                                 • Bind formal parameters
                                                                    (f & x) to arguments
result = apply twice(square, 2)
                                                                 • Execute the body:
                                                                    return f(f(x))
```

<u>Interactive Diagram</u>

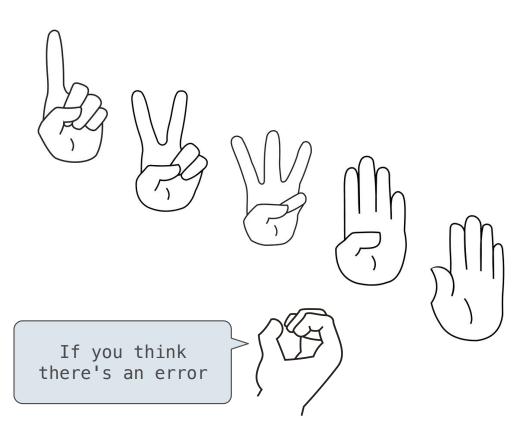

Discussion Question

What is the value of the final expression below? (Demo)

```
def repeat(f, x):
    while f(x) != x:
        x = f(x)
    return x

def g(y):
    return (y + 5) // 3

result = repeat(g, 5)
```

<u>Interactive Diagram</u>

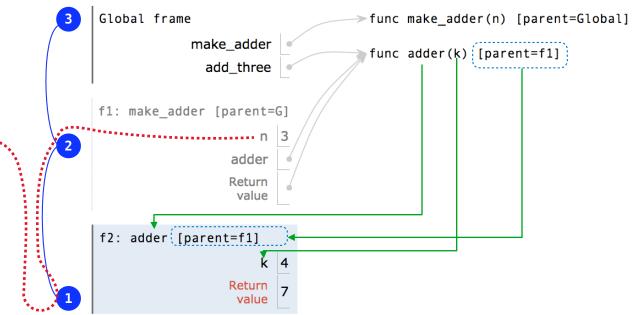

Environments for Nested Definitions

Environment Diagrams for Nested Def Statements

```
Nested def

1 def make_adder(n):
2 def adder(k):
3 return k + n
4 return adder
5
6 add_three = make_adder(3)
7 add_three(4)
```

- Every user-defined function has a parent frame (often global)
- The parent of a function is the frame in which it was defined
- Every local frame has a parent frame (often global)
- The parent of a frame is the parent of the function called

How to Draw an Environment Diagram

When a function is defined:

Create a function value: func <name>(<formal parameters>) [parent=<label>]
Its parent is the current frame.

```
f1: make_adder func adder(k) [parent=f1]
```

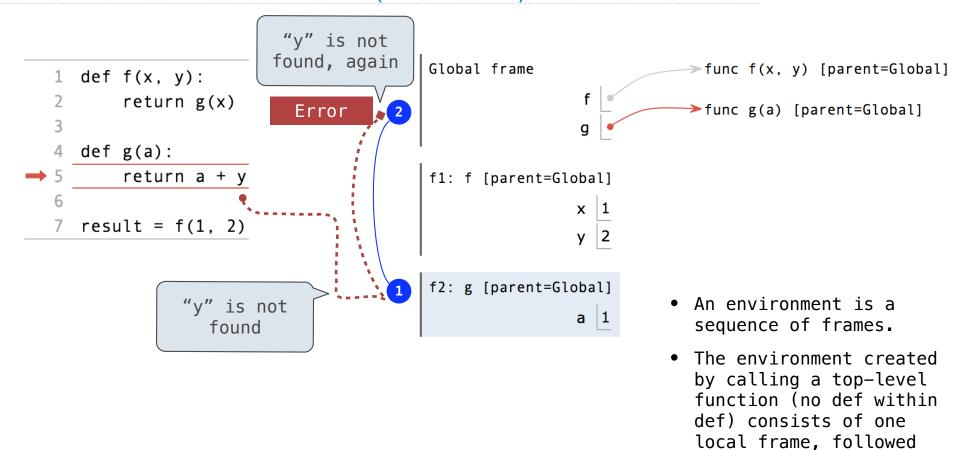

Bind <name> to the function value in the current frame

When a function is called:

- 1. Add a local frame, titled with the <name> of the function being called.
- ★ 2. Copy the parent of the function to the local frame: [parent=<label>]
 - 3. Bind the <formal parameters> to the arguments in the local frame.
 - 4. Execute the body of the function in the environment that starts with the local frame.

Local Names

Local Names are not Visible to Other (Non-Nested) Functions

by the global frame.

Function Composition

The Environment Diagram for Function Composition

```
Global frame
                                                                                                  func square(x) [parent=Global]
    def square(x):
                                                             3
                                                                                  square
         return x * x
                                                                                                 ►func make_adder(n) [parent=Global]
                                                                              make_adder
 3
                                                                                                 func compose1(f, g) [parent=Global]
                                                                                compose1
    def make adder(n):
                                                                                                  func adder(k) [parent=f1]
         def adder(k):
                                                                f1: make_adder [parent=Global]
              return k + n
                                                                                                  func h(x) [parent=f2]
         return adder
                                                                                   adder
                                                                                  Return
    def compose1(f, g):
10
         def h(x):
                                                                f2: compose1 [parent=Global]
11
              return f(g(x))
         return h
                                                                                   Return
14 compose1(square, make_adder(2))(3)
                                                                                    value
                                                                f3: h [parent=f2]
                                                                                     x 3
       Return value of make_adder is
           an argument to compose1
                                                                f4: adder [parent=f1]
                                                                                      k 3
```
